- Linux | Windows | macOS
- Python 3.7+
- PyTorch 1.5+
- CUDA 9.2+
- GCC 5+
- `mmcv` 1.3.12+
- `mmdet` 2.16.0+
- `mmcls` 0.15.0+

MMFewShot 和 MMCV, MMCLs, MMDet 版本兼容性如下所示, 需要安装正确的版本以避免安装出现问题。

**** 注意: **** 如果已经安装了 `mmcv`, 首先需要使用 `pip uninstall mmcv` 卸载已安装的 `mmcv`, 如果同时安装了 `mmcv` 和 `mmcv-full`, 将会报 `ModuleNotFoundError` 错误。

2.1 从零开始设置脚本

假设当前已经成功安装 CUDA 10.1，这里提供了一个完整的基于 conda 安装 MMFewShot 的脚本。您可以参考下一节中的分步安装说明。

```
conda create -n openmmlab python=3.7 -y
conda activate openmmlab

conda install pytorch==1.7.0 torchvision==0.8.0 torchaudio==0.7.0 cudatoolkit=10.1 -c
↳pytorch

pip install openmim
mim install mmcv-full

# install mmclassification mmdetection
mim install mmcls
mim install mmdet

# install mmfewshot
git clone https://github.com/open-mmlab/mmfewshot.git
cd mmfewshot
pip install -r requirements/build.txt
pip install -v -e . # or "python setup.py develop"
```

2.2 准备环境

1. 使用 conda 新建虚拟环境，并进入该虚拟环境；

```
conda create -n openmmlab python=3.7 -y
conda activate openmmlab
```

2. 基于 PyTorch 官网安装 PyTorch 和 torchvision，例如：

```
conda install pytorch torchvision -c pytorch
```

注意：需要确保 CUDA 的编译版本和运行版本匹配。可以在 PyTorch 官网查看预编译包所支持的 CUDA 版本。

例 1 例如在 /usr/local/cuda 下安装了 CUDA 10.1，并想安装 PyTorch 1.7，则需要安装支持 CUDA 10.1 的预构建 PyTorch：

```
conda install pytorch==1.7.0 torchvision==0.8.0 torchaudio==0.7.0 cudatoolkit=10.
↪1 -c pytorch
```

2.3 安装 MMFewShot

我们建议使用 MIM 来安装 MMFewShot：

```
pip install openmim
mim install mmfewshot
```

MIM 能够自动地安装 OpenMMLab 的项目以及对应的依赖包。

或者，可以手动安装 MMFewShot：

1. 安装 mmcv-full，我们建议使用预构建包来安装：

```
# pip install mmcv-full -f https://download.openmmlab.com/mmcv/dist/{cu_version}/
↪{torch_version}/index.html
pip install mmcv-full -f https://download.openmmlab.com/mmcv/dist/cu102/torch1.10.
↪0/index.html
```

PyTorch 在 1.x.0 和 1.x.1 之间通常是兼容的，故 mmcv-full 只提供 1.x.0 的编译包。如果你的 PyTorch 版本是 1.x.1，你可以放心地安装在 1.x.0 版本编译的 mmcv-full。

```
# 我们可以忽略 PyTorch 的小版本号
pip install mmcv-full -f https://download.openmmlab.com/mmcv/dist/cu102/torch1.10/
↪index.html
```

请参阅 [MMCV](#) 了解不同版本的 MMCV 与不同版本的 PyTorch 和 CUDA 的兼容情况。同时，您可以使用以下命令从源码编译 MMCV：

2. 安装 MMClassification 和 MMDetection.

你可以直接通过如下命令从 pip 安装使用 mmclassification 和 mmdetection：

```
pip install mmcls mmdet
```

3. 安装 MMFewShot.

你可以直接通过如下命令从 pip 安装使用 mmfewshot：

```
pip install mmfewshot
```

或者从 git 仓库编译源码：

```
git clone https://github.com/open-mmlab/mmfewshot.git
cd mmfewshot
pip install -r requirements/build.txt
pip install -v -e . # or "python setup.py develop"
```

Note:

- (1) 按照上述说明，MMDetection 安装在 dev 模式下，因此在本地对代码做的任何修改都会生效，无需重新安装；
- (2) 如果希望使用 opencv-python-headless 而不是 opencv-python，可以在安装 MMCV 之前安装；
- (3) 一些安装依赖是可以选择的。例如只需要安装最低运行要求的版本，则可以使用 `pip install -v -e .` 命令。如果希望使用可选择的像 `albumintations` 和 `imagecorruptions` 这种依赖项，可以使用 `pip install -r requirements/optional.txt` 进行手动安装，或者在使用 pip 时指定所需的附加功能（例如 `pip install -v -e .[optional]`），支持附加功能的有效键值包括 `all`、`tests`、`build` 以及 `optional`。

2.4 另一种选择：Docker 镜像

我们提供了 [Dockerfile](#) to build an image. Ensure that you are using `docker version >=19.03`.

```
# 基于 PyTorch 1.6, CUDA 10.1 生成镜像
docker build -t mmfewshot docker/
```

运行命令：

```
docker run --gpus all --shm-size=8g -it -v {DATA_DIR}:/mmfewshot/data mmfewshot
```

验证

为了验证是否正确安装了 MMFewShot 和所需的环境，我们可以运行示例的 Python 代码在示例图像进行推理：具体的细节可以参考 [few shot classification demo](#) 以及 [few shot detection demo](#)。如果成功安装 MMFewShot，则上面的代码可以完整地运行。

CHAPTER 4

准备数据集

具体的细节可以参考 [准备数据](#) 下载并组织数据集。

- single GPU
- CPU
- single node multiple GPU
- multiple node

You can use the following commands to infer a dataset.

```
# single-gpu
python tools/test.py ${CONFIG_FILE} ${CHECKPOINT_FILE} [optional arguments]

# CPU: disable GPUs and run single-gpu testing script
export CUDA_VISIBLE_DEVICES=-1
python tools/test.py ${CONFIG_FILE} ${CHECKPOINT_FILE} [optional arguments]

# multi-gpu
sh ./tools/dist_test.sh ${CONFIG_FILE} ${CHECKPOINT_FILE} ${GPU_NUM} [optional_
↪arguments]

# multi-node in slurm environment
python tools/test.py ${CONFIG_FILE} ${CHECKPOINT_FILE} [optional arguments] --
↪launcher slurm
```

Examples:

For classification, inference Baseline on CUB under 5way 1shot setting.

mmfewshot

```
python ./tools/classification/test.py \  
  configs/classification/baseline/cub/baseline_conv4_1xb64_cub_5way-1shot.py \  
  checkpoints/SOME_CHECKPOINT.pth
```

For detection, inference TFA on VOC split1 1shot setting.

```
python ./tools/detection/test.py \  
  configs/detection/tfa/voc/split1/tfa_r101_fpn_voc-split1_1shot-fine-tuning.py \  
  checkpoints/SOME_CHECKPOINT.pth --eval mAP
```

6.1 Train with a single GPU

```
python tools/train.py ${CONFIG_FILE} [optional arguments]
```

If you want to specify the working directory in the command, you can add an argument `--work_dir` `${YOUR_WORK_DIR}`.

6.2 Train on CPU

The process of training on the CPU is consistent with single GPU training. We just need to disable GPUs before the training process.

```
export CUDA_VISIBLE_DEVICES=-1
python tools/train.py ${CONFIG_FILE} [optional arguments]
```

Note:

We do not recommend users to use CPU for training because it is too slow. We support this feature to allow users to debug on machines without GPU for convenience.

6.3 Train with multiple GPUs

```
sh ./tools/dist_train.sh ${CONFIG_FILE} ${GPU_NUM} [optional arguments]
```

Optional arguments are:

- `--no-validate` (**not suggested**): By default, the codebase will perform evaluation during the training. To disable this behavior, use `--no-validate`.
- `--work-dir` `${WORK_DIR}`: Override the working directory specified in the config file.
- `--resume-from` `${CHECKPOINT_FILE}`: Resume from a previous checkpoint file.

Difference between `resume-from` and `load-from`: `resume-from` loads both the model weights and optimizer status, and the epoch is also inherited from the specified checkpoint. It is usually used for resuming the training process that is interrupted accidentally. `load-from` only loads the model weights and the training epoch starts from 0. It is usually used for finetuning.

6.4 Train with multiple machines

If you launch with multiple machines simply connected with ethernet, you can simply run following commands:

On the first machine:

```
NNODES=2 NODE_RANK=0 PORT=$MASTER_PORT MASTER_ADDR=$MASTER_ADDR sh tools/dist_train.  
↪ sh $CONFIG $GPUS
```

On the second machine:

```
NNODES=2 NODE_RANK=1 PORT=$MASTER_PORT MASTER_ADDR=$MASTER_ADDR sh tools/dist_train.  
↪ sh $CONFIG $GPUS
```

Usually it is slow if you do not have high speed networking like InfiniBand.

If you run MMClassification on a cluster managed with `slurm`, you can use the script `slurm_train.sh`. (This script also supports single machine training.)

```
[GPUS=${GPUS}] sh ./tools/slurm_train.sh ${PARTITION} ${JOB_NAME} ${CONFIG_FILE} $  
↪ {WORK_DIR}
```

You can check `slurm_train.sh` for full arguments and environment variables.

If you have just multiple machines connected with ethernet, you can refer to PyTorch [launch utility](#). Usually it is slow if you do not have high speed networking like InfiniBand.

6.5 Launch multiple jobs on a single machine

If you launch multiple jobs on a single machine, e.g., 2 jobs of 4-GPU training on a machine with 8 GPUs, you need to specify different ports (29500 by default) for each job to avoid communication conflict.

If you use `dist_train.sh` to launch training jobs, you can set the port in commands.

```
CUDA_VISIBLE_DEVICES=0,1,2,3 PORT=29500 sh ./tools/dist_train.sh ${CONFIG_FILE} 4
CUDA_VISIBLE_DEVICES=4,5,6,7 PORT=29501 sh ./tools/dist_train.sh ${CONFIG_FILE} 4
```

If you use launch training jobs with Slurm, you need to modify the config files (usually the 6th line from the bottom in config files) to set different communication ports.

In `config1.py`,

```
dist_params = dict(backend='nccl', port=29500)
```

In `config2.py`,

```
dist_params = dict(backend='nccl', port=29501)
```

Then you can launch two jobs with `config1.py` and `config2.py`.

```
CUDA_VISIBLE_DEVICES=0,1,2,3 GPUS=4 sh ./tools/slurm_train.sh ${PARTITION} ${JOB_NAME}
→ config1.py ${WORK_DIR}
CUDA_VISIBLE_DEVICES=4,5,6,7 GPUS=4 sh ./tools/slurm_train.sh ${PARTITION} ${JOB_NAME}
→ config2.py ${WORK_DIR}
```

Tutorial 0: Overview of MMFewShot Classification

The main difference between general classification task and few shot classification task is the data usage. Therefore, the design of MMFewShot target at data sampling, meta test and models apis for few shot setting based on `mmcls`. Additionally, the modules in `mmcls` can be imported and reused in the code or config.

8.1 Design of Data Sampling

In MMFewShot, we suggest customizing the data pipeline using a dataset wrapper and modify the arguments in forward function when returning the dict with customize keys.

```
class CustomizeDataset:

    def __init__(self, dataset, ...):
        self.dataset = dataset
        self.customize_list = generate_function(dataset)

    def generate_function(self, dataset):
        pass

    def __getitem__(self, idx):
        return {
            'support_data': [self.dataset[i] for i in self.customize_list],
            'query_data': [self.dataset[i] for i in self.customize_list]
        }
```

More details can refer to [Tutorial 2: Adding New Dataset](#)

8.2 Design of Models API

Each model in MMFewShot should implement following functions to support meta testing. More details can refer to [Tutorial 3: Customize Models](#)

```
@CLASSIFIERS.register_module()
class BaseFewShotClassifier(BaseModule):

    def forward(self, mode, ...):
        if mode == 'train':
            return self.forward_train(...)
        elif mode == 'query':
            return self.forward_query(...)
        elif mode == 'support':
            return self.forward_support(...)
        ...

    def forward_train(self, **kwargs):
        pass

    # ----- for meta testing -----
    def forward_support(self, **kwargs):
        pass

    def forward_query(self, **kwargs):
        pass

    def before_meta_test(self, meta_test_cfg, **kwargs):
        pass

    def before_forward_support(self, **kwargs):
        pass

    def before_forward_query(self, **kwargs):
        pass
```

8.3 Design of Meta Testing

Meta testing performs prediction on random sampled tasks multiple times. Each task contains support and query data. More details can refer to `mmfewshot/classification/apis/test.py`. Here is the basic pipeline for meta testing:

```
# the model may from training phase and may generate or fine-tune weights
1. Copy model
# prepare for the meta test (generate or freeze weights)
2. Call model.before_meta_test()
# some methods with fixed backbone can pre-compute the features for acceleration
3. Extracting features of all images for acceleration(optional)
# test different random sampled tasks
4. Test tasks (loop)
    # make sure all the task share the same initial weight
    a. Copy model
    # prepare model for support data
    b. Call model.before_forward_support()
    # fine-tune or none fine-tune models with given support data
    c. Forward support data: model(*data, mode='support')
    # prepare model for query data
    d. Call model.before_forward_query()
    # predict results of query data
    e. Forward query data: model(*data, mode='query')
```

8.3.1 meta testing on multiple gpus

In MMFewShot, we also support multi-gpu meta testing during validation or testing phase. In multi-gpu meta testing, the model will be copied and wrapped with `MetaTestParallel`, which will send data to the device of model. Thus, the original model will not be affected by the operations in Meta Testing. More details can refer to `mmfewshot/classification/utils/meta_test_parallel.py` Specifically, each gpu will be assigned with $(\text{num_test_tasks} / \text{world_size})$ task. Here is the distributed logic for multi gpu meta testing:

```
sub_num_test_tasks = num_test_tasks // world_size
sub_num_test_tasks += 1 if num_test_tasks % world_size != 0 else 0
for i in range(sub_num_test_tasks):
    task_id = (i * world_size + rank)
    if task_id >= num_test_tasks:
        continue
    # test task with task_id
    ...
```

If user want to customize the way to test a task, more details can refer to [Tutorial 4: Customize Runtime Settings](#)

Tutorial 1: Learn about Configs

We incorporate modular and inheritance design into our config system, which is convenient to conduct various experiments. If you wish to inspect the config file, you may run `python tools/misc/print_config.py /PATH/TO/CONFIG` to see the complete config. The classification part of `mmfewshot` is built upon the `mmcls`, thus it is highly recommended learning the basic of `mmcls`.

9.1 Modify config through script arguments

When submitting jobs using “`tools/classification/train.py`” or “`tools/classification/test.py`”, you may specify `--cfg-options` to in-place modify the config.

- Update config keys of dict chains.

The config options can be specified following the order of the dict keys in the original config. For example, `--cfg-options model.backbone.norm_eval=False` changes the all BN modules in model backbones to `train` mode.

- Update keys inside a list of configs.

Some config dicts are composed as a list in your config. For example, the training pipeline `data.train.pipeline` is normally a list e.g. `[dict(type='LoadImageFromFile'), ...]`. If you want to change `'LoadImageFromFile'` to `'LoadImageFromWebcam'` in the pipeline, you may specify `--cfg-options data.train.pipeline.0.type=LoadImageFromWebcam`.

- Update values of list/tuples.

If the value to be updated is a list or a tuple. For example, the config file normally sets `workflow=[('train', 1)]`. If you want to change this key, you may specify `--cfg-options workflow="[(train,1),(val,1)]"`. Note that the quotation mark " is necessary to support list/tuple data types, and that **NO** white space is allowed inside the quotation marks in the specified value.

9.2 Config Name Style

We follow the below style to name config files. Contributors are advised to follow the same style.

```
{algorithm}_{algorithm setting}_{backbone}_{gpu x batch_per_gpu}_{misc}_{dataset}_
↪{meta test setting}.py
```

{xxx} is required field and [yyy] is optional.

- {algorithm}: model type like `faster_rcnn`, `mask_rcnn`, etc.
- [algorithm setting]: specific setting for some model, like `without_semantic` for `htc`, `moment` for `repoints`, etc.
- {backbone}: backbone type like `conv4`, `resnet12`.
- [norm_setting]: `bn` (Batch Normalization) is used unless specified, other norm layer type could be `gn` (Group Normalization), `syncbn` (Synchronized Batch Normalization). `gn-head/gn-neck` indicates GN is applied in head/neck only, while `gn-all` means GN is applied in the entire model, e.g. backbone, neck, head.
- [gpu x batch_per_gpu]: GPUs and samples per GPU. For episodic training methods we use the total number of images in one episode, i.e. `n classes x (support images+query images)`.
- [misc]: miscellaneous setting/plugins of model.
- {dataset}: dataset like `cub`, `mini-imagenet` and `tiered-imagenet`.
- {meta test setting}: n way k shot setting like `5way_1shot` or `5way_5shot`.

9.3 An Example of Baseline

To help the users have a basic idea of a complete config and the modules in a modern classification system, we make brief comments on the config of Baseline for MiniImageNet in 5 way 1 shot setting as the following. For more detailed usage and the corresponding alternative for each module, please refer to the API documentation.

```
# config of model
model = dict(
    # classifier name
    type='Baseline',
    # config of backbone
```

(下页继续)

(续上页)

```

backbone=dict(type='Conv4'),
# config of classifier head
head=dict(type='LinearHead', num_classes=64, in_channels=1600),
# config of classifier head used in meta test
meta_test_head=dict(type='LinearHead', num_classes=5, in_channels=1600))

# data pipeline for training
train_pipeline = [
    # first pipeline to load images from file path
    dict(type='LoadImageFromFile'),
    # random resize crop
    dict(type='RandomResizedCrop', size=84),
    # random flip
    dict(type='RandomFlip', flip_prob=0.5, direction='horizontal'),
    # color jitter
    dict(type='ColorJitter', brightness=0.4, contrast=0.4, saturation=0.4),
    dict(type='Normalize', # normalization
        # mean values used to normalization
        mean=[123.675, 116.28, 103.53],
        # standard variance used to normalization
        std=[58.395, 57.12, 57.375],
        # whether to invert the color channel, rgb2bgr or bgr2rgb
        to_rgb=True),
    # convert img into torch.Tensor
    dict(type='ImageToTensor', keys=['img']),
    # convert gt_label into torch.Tensor
    dict(type='ToTensor', keys=['gt_label']),
    # pipeline that decides which keys in the data should be passed to the runner
    dict(type='Collect', keys=['img', 'gt_label'])
]

# data pipeline for testing
test_pipeline = [
    # first pipeline to load images from file path
    dict(type='LoadImageFromFile'),
    # resize image
    dict(type='Resize', size=(96, -1)),
    # center crop
    dict(type='CenterCrop', crop_size=84),
    dict(type='Normalize', # normalization
        # mean values used to normalization
        mean=[123.675, 116.28, 103.53],
        # standard variance used to normalization

```

(下页继续)

```
        std=[58.395, 57.12, 57.375],
        # whether to invert the color channel, rgb2bgr or bgr2rgb
        to_rgb=True),
    # convert img into torch.Tensor
    dict(type='ImageToTensor', keys=['img']),
    # pipeline that decides which keys in the data should be passed to the runner
    dict(type='Collect', keys=['img', 'gt_label'])
]

# config of fine-tuning using support set in Meta Test
meta_finetune_cfg = dict(
    # number of iterations in fine-tuning
    num_steps=150,
    # optimizer config in fine-tuning
    optimizer=dict(
        type='SGD', # optimizer name
        lr=0.01, # learning rate
        momentum=0.9, # momentum
        dampening=0.9, # dampening
        weight_decay=0.001)), # weight decay

    data = dict(
        # batch size of a single GPU
        samples_per_gpu=64,
        # worker to pre-fetch data for each single GPU
        workers_per_gpu=4,
        # config of training set
        train=dict(
            # name of dataset
            type='MiniImageNetDataset',
            # prefix of image
            data_prefix='data/mini_imagenet',
            # subset of dataset
            subset='train',
            # train pipeline
            pipeline=train_pipeline),
        # config of validation set
        val=dict(
            # dataset wrapper for Meta Test
            type='MetaTestDataset',
            # total number of test tasks

```

9.4 FAQ

9.4.1 Use intermediate variables in configs

Some intermediate variables are used in the configuration file. The intermediate variables make the configuration file clearer and easier to modify.

For example, `train_pipeline / test_pipeline` is the intermediate variable of the data pipeline. We first need to define `train_pipeline / test_pipeline`, and then pass them to `data`. If you want to modify the size of the input image during training and testing, you need to modify the intermediate variables of `train_pipeline / test_pipeline`.

```

img_norm_cfg = dict(
    mean=[123.675, 116.28, 103.53], std=[58.395, 57.12, 57.375], to_rgb=True)
train_pipeline = [
    dict(type='LoadImageFromFile'),
    dict(type='RandomResizedCrop', size=384, backend='pillow'),
    dict(type='RandomFlip', flip_prob=0.5, direction='horizontal'),
    dict(type='Normalize', **img_norm_cfg),
    dict(type='ImageToTensor', keys=['img']),
    dict(type='ToTensor', keys=['gt_label']),
    dict(type='Collect', keys=['img', 'gt_label'])
]
test_pipeline = [
    dict(type='LoadImageFromFile'),

```

(下页继续)

```
dict(type='Resize', size=384, backend='pillow'),
dict(type='Normalize', **img_norm_cfg),
dict(type='ImageToTensor', keys=['img']),
dict(type='Collect', keys=['img'])
]
data = dict(
    train=dict(pipeline=train_pipeline),
    val=dict(pipeline=test_pipeline),
    test=dict(pipeline=test_pipeline))
```

9.4.2 Ignore some fields in the base configs

Sometimes, you need to set `_delete_=True` to ignore some domain content in the basic configuration file. You can refer to [mmcv](#) for more instructions.

The following is an example. If you want to use cosine schedule, just using inheritance and directly modify it will report `get_unexpected keyword 'step' error`, because the `'step'` field of the basic config in `lr_config` domain information is reserved, and you need to add `_delete_=True` to ignore the content of `lr_config` related fields in the basic configuration file:

```
lr_config = dict(
    _delete_=True,
    policy='CosineAnnealing',
    min_lr=0,
    warmup='linear',
    by_epoch=True,
    warmup_iters=5,
    warmup_ratio=0.1
)
```

Tutorial 2: Adding New Dataset

10.1 Customize datasets by reorganizing data

10.1.1 Customize loading annotations

You can write a new Dataset class inherited from `BaseFewShotDataset`, and overwrite `load_annotations(self)`, like `CUB` and `MiniImageNet`. Typically, this function returns a list, where each sample is a dict, containing necessary data information, e.g., `img` and `gt_label`.

Assume we are going to implement a `Filelist` dataset, which takes filelists for both training and testing. The format of annotation list is as follows:

```
000001.jpg 0
000002.jpg 1
```

We can create a new dataset in `mmfewshot/classification/datasets/filelist.py` to load the data.

```
import mmcv
import numpy as np

from mmcls.datasets.builder import DATASETS
from .base import BaseFewShotDataset

@DATASETS.register_module()
```

(下页继续)

```

class Filelist(BaseFewShotDataset):

    def load_annotations(self):
        assert isinstance(self.ann_file, str)

        data_infos = []
        with open(self.ann_file) as f:
            samples = [x.strip().split(' ') for x in f.readlines()]
            for filename, gt_label in samples:
                info = {'img_prefix': self.data_prefix}
                info['img_info'] = {'filename': filename}
                info['gt_label'] = np.array(gt_label, dtype=np.int64)
                data_infos.append(info)
        return data_infos

```

And add this dataset class in mmcls/datasets/__init__.py

```

from .base_dataset import BaseDataset
...
from .filelist import Filelist

__all__ = [
    'BaseDataset', ... , 'Filelist'
]

```

Then in the config, to use Filelist you can modify the config as the following

```

train = dict(
    type='Filelist',
    ann_file = 'image_list.txt',
    pipeline=train_pipeline
)

```

10.1.2 Customize different subsets

To support different subset, we first predefine the classes of different subsets. Then we modify `get_classes` to handle different classes of subset.

```

import mmcv
import numpy as np

from mmcls.datasets.builder import DATASETS

```

(续上页)

```

from .base import BaseFewShotDataset

@DATASETS.register_module()
class Filelist(BaseFewShotDataset):

    TRAIN_CLASSES = ['train_a', ...]
    VAL_CLASSES = ['val_a', ...]
    TEST_CLASSES = ['test_a', ...]

    def __init__(self, subset, *args, **kwargs):
        ...
        self.subset = subset
        super().__init__(*args, **kwargs)

    def get_classes(self):
        if self.subset == 'train':
            class_names = self.TRAIN_CLASSES
        ...
        return class_names

```

10.2 Customize datasets sampling

10.2.1 EpisodicDataset

We use `EpisodicDataset` as wrapper to perform N way K shot sampling. For example, suppose the original dataset is `Dataset_A`, the config looks like the following

```

dataset_A_train = dict(
    type='EpisodicDataset',
    num_episodes=100000, # number of total episodes = length of dataset wrapper
    # each call of `__getitem__` will return
    # {'support_data': [(num_ways * num_shots) images],
    #  'query_data': [(num_ways * num_queries) images]}
    num_ways=5, # number of way (different classes)
    num_shots=5, # number of support shots of each class
    num_queries=5, # number of query shots of each class
    dataset=dict( # This is the original config of Dataset_A
        type='Dataset_A',
        ...
        pipeline=train_pipeline
    )
)

```

10.2.2 Customize sampling logic

An example of customizing data sampling logic for training:

Create a new dataset wrapper

We can create a new dataset wrapper in `mmfewshot/classification/datasets/dataset_wrappers.py` to customize sampling logic.

```
class MyDatasetWrapper:
    def __init__(self, dataset, args_a, args_b, ...):
        self.dataset = dataset
        ...
        self.episode_idxes = self.generate_episodic_idxes()

    def generate_episodic_idxes(self):
        episode_idxes = []
        # sampling each episode
        for _ in range(self.num_episodes):
            episodic_a_idx, episodic_b_idx, episodic_c_idx= [], [], []
            # customize sampling logic
            # select the index of data_infos from original dataset
            ...
            episode_idxes.append({
                'a': episodic_a_idx,
                'b': episodic_b_idx,
                'c': episodic_c_idx,
            })
        return episode_idxes

    def __getitem__(self, idx):
        # the key can be any value, but it needs to modify the code
        # in the forward function of model.
        return {
            'a_data' : [self.dataset[i] for i in self.episode_idxes[idx]['a']],
            'b_data' : [self.dataset[i] for i in self.episode_idxes[idx]['b']],
            'c_data' : [self.dataset[i] for i in self.episode_idxes[idx]['c']]
        }
```

Update dataset builder

We need to add the build code in mmfewshot/classification/datasets/builder.py for our customize dataset wrapper.

```
def build_dataset(cfg, default_args=None):
    if isinstance(cfg, (list, tuple)):
        dataset = ConcatDataset([build_dataset(c, default_args) for c in cfg])
        ...
    elif cfg['type'] == 'MyDatasetWrapper':
        dataset = MyDatasetWrapper(
            build_dataset(cfg['dataset'], default_args),
            # pass customize arguments
            args_a=cfg['args_a'],
            args_b=cfg['args_b'],
            ...)
    else:
        dataset = build_from_cfg(cfg, DATASETS, default_args)

    return dataset
```

Update the arguments in model

The argument names in forward function need to be consistent with the customize dataset wrapper.

```
class MyClassifier(BaseFewShotClassifier):
    ...
    def forward(self, a_data=None, b_data=None, c_data=None, ...):
        # pass the modified arguments name.
        if mode == 'train':
            return self.forward_train(a_data=a_data, b_data=b_data, c_data=None,
↳**kwargs)
        elif mode == 'query':
            return self.forward_query(img=img, **kwargs)
        elif mode == 'support':
            return self.forward_support(img=img, **kwargs)
        elif mode == 'extract_feat':
            return self.extract_feat(img=img)
        else:
            raise ValueError()
```

using customize dataset wrapper in config

Then in the config, to use `MyDatasetWrapper` you can modify the config as the following,

```
dataset_A_train = dict(  
    type='MyDatasetWrapper',  
    args_a=None,  
    args_b=None,  
    dataset=dict( # This is the original config of Dataset_A  
        type='Dataset_A',  
        ...  
        pipeline=train_pipeline  
    )  
)
```

11.1 Add a new classifier

Here we show how to develop a new classifier with an example as follows

11.1.1 1. Define a new classifier

Create a new file `mmfewshot/classification/models/classifiers/my_classifier.py`.

```
from mmcls.models.builder import CLASSIFIERS
from .base import BaseFewShotClassifier

@CLASSIFIERS.register_module()
class MyClassifier(BaseFewShotClassifier):

    def __init__(self, arg1, arg2):
        pass

    # customize input for different mode
    # the input should keep consistent with the dataset
    def forward(self, img, mode='train', **kwargs):
        if mode == 'train':
            return self.forward_train(img=img, **kwargs)
        elif mode == 'query':
```

(下页继续)

```

        return self.forward_query(img=img, **kwargs)
    elif mode == 'support':
        return self.forward_support(img=img, **kwargs)
    elif mode == 'extract_feat':
        assert img is not None
        return self.extract_feat(img=img)
    else:
        raise ValueError()

# customize forward function for training data
def forward_train(self, img, gt_label, **kwargs):
    pass

# customize forward function for meta testing support data
def forward_support(self, img, gt_label, **kwargs):
    pass

# customize forward function for meta testing query data
def forward_query(self, img):
    pass

# prepare meta testing
def before_meta_test(self, meta_test_cfg, **kwargs):
    pass

# prepare forward meta testing query images
def before_forward_support(self, **kwargs):
    pass

# prepare forward meta testing support images
def before_forward_query(self, **kwargs):
    pass

```

11.1.2 2. Import the module

You can either add the following line to `mmfewshot/classification/models/heads/__init__.py`

```
from .my_classifier import MyClassifier
```

or alternatively add

```
custom_imports = dict(
    imports=['mmfewshot.classification.models.classifier.my_classifier'],
```

(下页继续)

(续上页)

```
allow_failed_imports=False)
```

to the config file to avoid modifying the original code.

11.1.3 3. Use the classifier in your config file

```
model = dict(  
    type="MyClassifier",  
    ...  
)
```

11.2 Add a new backbone

Here we show how to develop a new backbone with an example as follows

11.2.1 1. Define a new backbone

Create a new file `mmfewshot/classification/models/backbones/mynet.py`.

```
import torch.nn as nn  
  
from mmcls.models.builder import BACKBONES  
  
@BACKBONES.register_module()  
class MyNet(nn.Module):  
  
    def __init__(self, arg1, arg2):  
        pass  
  
    def forward(self, x): # should return a tensor  
        pass
```

11.2.2 2. Import the module

You can either add the following line to `mmfewshot/classification/models/backbones/__init__.py`

```
from .mynet import MyNet
```

or alternatively add

```
custom_imports = dict(  
    imports=['mmfewshot.classification.models.backbones.mynet'],  
    allow_failed_imports=False)
```

to the config file to avoid modifying the original code.

11.2.3 3. Use the backbone in your config file

```
model = dict(  
    ...  
    backbone=dict(  
        type='MyNet',  
        arg1=xxx,  
        arg2=xxx),  
    ...
```

11.3 Add new heads

Here we show how to develop a new head with an example as follows

11.3.1 1. Define a new head

Create a new file `mmfewshot/classification/models/heads/myhead.py`.

```
from mmcls.models.builder import HEADS  
from .base_head import BaseFewShotHead  
  
@HEADS.register_module()  
class MyHead(BaseFewShotHead):  
  
    def __init__(self, arg1, arg2) -> None:  
        pass
```

(下页继续)

(续上页)

```

def forward_train(self, x, gt_label, **kwargs):
    pass

def forward_support(self, x, gt_label, **kwargs):
    pass

def forward_query(self, x, **kwargs):
    pass

def before_forward_support(self) -> None:
    pass

def before_forward_query(self) -> None:
    pass

```

11.3.2 2. Import the module

You can either add the following line to `mmfewshot/classification/models/heads/__init__.py`

```
from .myhead import MyHead
```

or alternatively add

```

custom_imports = dict(
    imports=['mmfewshot.classification.models.backbones.myhead'],
    allow_failed_imports=False)

```

to the config file to avoid modifying the original code.

11.3.3 3. Use the head in your config file

```

model = dict(
    ...
    head=dict(
        type='MyHead',
        arg1=xxx,
        arg2=xxx),
    ...

```

11.4 Add new loss

To add a new loss function, the users need implement it in `mmfewshot/classification/models/losses/my_loss.py`. The decorator `weighted_loss` enable the loss to be weighted for each element.

```
import torch
import torch.nn as nn

from ..builder import LOSSES
from .utils import weighted_loss

@weighted_loss
def my_loss(pred, target):
    assert pred.size() == target.size() and target.numel() > 0
    loss = torch.abs(pred - target)
    return loss

@LOSSES.register_module()
class MyLoss(nn.Module):

    def __init__(self, reduction='mean', loss_weight=1.0):
        super(MyLoss, self).__init__()
        self.reduction = reduction
        self.loss_weight = loss_weight

    def forward(self,
                pred,
                target,
                weight=None,
                avg_factor=None,
                reduction_override=None):
        assert reduction_override in (None, 'none', 'mean', 'sum')
        reduction = (
            reduction_override if reduction_override else self.reduction)
        loss_bbox = self.loss_weight * my_loss(
            pred, target, weight, reduction=reduction, avg_factor=avg_factor)
        return loss_bbox
```

Then the users need to add it in the `mmfewshot/classification/models/losses/__init__.py`.

```
from .my_loss import MyLoss, my_loss
```

Alternatively, you can add

```
custom_imports=dict(  
    imports=['mmfewshot.classification.models.losses.my_loss'])
```

to the config file and achieve the same goal.

To use it, modify the `loss_XXX` field. Since `MyLoss` is for regression, you need to modify the `loss_bbox` field in the head.

```
loss_bbox=dict(type='MyLoss', loss_weight=1.0))
```

Tutorial 4: Customize Runtime Settings

12.1 Customize optimization settings

12.1.1 Customize optimizer supported by Pytorch

We already support to use all the optimizers implemented by PyTorch, and the only modification is to change the `optimizer` field of config files. For example, if you want to use ADAM (note that the performance could drop a lot), the modification could be as the following.

```
optimizer = dict(type='Adam', lr=0.0003, weight_decay=0.0001)
```

To modify the learning rate of the model, the users only need to modify the `lr` in the config of optimizer. The users can directly set arguments following the [API doc](#) of PyTorch.

12.1.2 Customize self-implemented optimizer

1. Define a new optimizer

A customized optimizer could be defined as following.

Assume you want to add a optimizer named `MyOptimizer`, which has arguments `a`, `b`, and `c`. You need to create a new directory named `mmfewshot/classification/core/optimizer`. And then implement the new optimizer in a file, e.g., in `mmfewshot/classification/core/optimizer/my_optimizer.py`:

```
from .registry import OPTIMIZERS
from torch.optim import Optimizer

@OPTIMIZERS.register_module()
class MyOptimizer(Optimizer):

    def __init__(self, a, b, c)
```

2. Add the optimizer to registry

To find the above module defined above, this module should be imported into the main namespace at first. There are two options to achieve it.

- Modify `mmfewshot/classification/core/optimizer/__init__.py` to import it.

The newly defined module should be imported in `mmfewshot/classification/core/optimizer/__init__.py` so that the registry will find the new module and add it:

```
from .my_optimizer import MyOptimizer
```

- Use `custom_imports` in the config to manually import it

```
custom_imports = dict(imports=['mmfewshot.classification.core.optimizer.my_optimizer
↪'], allow_failed_imports=False)
```

The module `mmfewshot.classification.core.optimizer.my_optimizer` will be imported at the beginning of the program and the class `MyOptimizer` is then automatically registered. Note that only the package containing the class `MyOptimizer` should be imported. `mmfewshot.classification.core.optimizer.my_optimizer.MyOptimizer` **cannot** be imported directly.

Actually users can use a totally different file directory structure using this importing method, as long as the module root can be located in `PYTHONPATH`.

3. Specify the optimizer in the config file

Then you can use `MyOptimizer` in `optimizer` field of config files. In the configs, the optimizers are defined by the field `optimizer` like the following:

```
optimizer = dict(type='SGD', lr=0.02, momentum=0.9, weight_decay=0.0001)
```

To use your own optimizer, the field can be changed to

```
optimizer = dict(type='MyOptimizer', a=a_value, b=b_value, c=c_value)
```

12.1.3 Customize optimizer constructor

Some models may have some parameter-specific settings for optimization, e.g. weight decay for BatchNorm layers. The users can do those fine-grained parameter tuning through customizing optimizer constructor.

```
from mmcv.utils import build_from_cfg

from mmcv.runner.optimizer import OPTIMIZER_BUILDERS, OPTIMIZERS
from mmfewshot.utils import get_root_logger
from .my_optimizer import MyOptimizer

@OPTIMIZER_BUILDERS.register_module()
class MyOptimizerConstructor(object):

    def __init__(self, optimizer_cfg, paramwise_cfg=None):

    def __call__(self, model):

        return my_optimizer
```

The default optimizer constructor is implemented [here](#), which could also serve as a template for new optimizer constructor.

12.1.4 Additional settings

Tricks not implemented by the optimizer should be implemented through optimizer constructor (e.g., set parameter-wise learning rates) or hooks. We list some common settings that could stabilize the training or accelerate the training. Feel free to create PR, issue for more settings.

- **Use gradient clip to stabilize training:** Some models need gradient clip to clip the gradients to stabilize the training process. An example is as below:

```
optimizer_config = dict(grad_clip=dict(max_norm=35, norm_type=2))
```

- **Use momentum schedule to accelerate model convergence:** We support momentum scheduler to modify model's momentum according to learning rate, which could make the model converge in a faster way. Momentum scheduler is usually used with LR scheduler, for example, the following config is used in 3D detection to accelerate convergence. For more details, please refer to the implementation of [CyclicLrUpdater](#) and [CyclicMomentumUpdater](#).

```

lr_config = dict(
    policy='cyclic',
    target_ratio=(10, 1e-4),
    cyclic_times=1,
    step_ratio_up=0.4,
)
momentum_config = dict(
    policy='cyclic',
    target_ratio=(0.85 / 0.95, 1),
    cyclic_times=1,
    step_ratio_up=0.4,
)

```

12.2 Customize training schedules

By default we use step learning rate with 1x schedule, this calls `StepLRHook` in MMCV. We support many other learning rate schedule [here](#), such as `CosineAnnealing` and `Poly` schedule. Here are some examples

- Poly schedule:

```
lr_config = dict(policy='poly', power=0.9, min_lr=1e-4, by_epoch=False)
```

- CosineAnnealing schedule:

```

lr_config = dict(
    policy='CosineAnnealing',
    warmup='linear',
    warmup_iters=1000,
    warmup_ratio=1.0 / 10,
    min_lr_ratio=1e-5)

```

12.3 Customize workflow

Workflow is a list of (phase, epochs) to specify the running order and epochs. By default it is set to be

```
workflow = [('train', 1)]
```

which means running 1 epoch for training. Sometimes user may want to check some metrics (e.g. loss, accuracy) about the model on the validate set. In such case, we can set the workflow as

```
[('train', 1), ('val', 1)]
```

so that 1 epoch for training and 1 epoch for validation will be run iteratively.

Note:

1. The parameters of model will not be updated during val epoch.
2. Keyword `total_epochs` in the config only controls the number of training epochs and will not affect the validation workflow.
3. Workflows `[('train', 1), ('val', 1)]` and `[('train', 1)]` will not change the behavior of EvalHook because EvalHook is called by `after_train_epoch` and validation workflow only affect hooks that are called through `after_val_epoch`. Therefore, the only difference between `[('train', 1), ('val', 1)]` and `[('train', 1)]` is that the runner will calculate losses on validation set after each training epoch.

12.4 Customize hooks

12.4.1 Customize self-implemented hooks

1. Implement a new hook

Here we give an example of creating a new hook in MMFewShot and using it in training.

```
from mmcv.runner import HOOKS, Hook

@HOOKS.register_module()
class MyHook(Hook):

    def __init__(self, a, b):
        pass

    def before_run(self, runner):
        pass

    def after_run(self, runner):
        pass

    def before_epoch(self, runner):
        pass

    def after_epoch(self, runner):
        pass
```

(下页继续)

```
def before_iter(self, runner):
    pass

def after_iter(self, runner):
    pass
```

Depending on the functionality of the hook, the users need to specify what the hook will do at each stage of the training in `before_run`, `after_run`, `before_epoch`, `after_epoch`, `before_iter`, and `after_iter`.

2. Register the new hook

Then we need to make `MyHook` imported. Assuming the file is in `mmfewshot/classification/core/utils/my_hook.py` there are two ways to do that:

- Modify `mmfewshot/core/utils/__init__.py` to import it.

The newly defined module should be imported in `mmfewshot/classification/core/utils/__init__.py` so that the registry will find the new module and add it:

```
from .my_hook import MyHook
```

- Use `custom_imports` in the config to manually import it

```
custom_imports = dict(imports=['mmfewshot.classification.core.utils.my_hook'], allow_
↪failed_imports=False)
```

3. Modify the config

```
custom_hooks = [
    dict(type='MyHook', a=a_value, b=b_value)
]
```

You can also set the priority of the hook by adding key `priority` to 'NORMAL' or 'HIGHEST' as below

```
custom_hooks = [
    dict(type='MyHook', a=a_value, b=b_value, priority='NORMAL')
]
```

By default the hook's priority is set as `NORMAL` during registration.

12.4.2 Use hooks implemented in MMCV

If the hook is already implemented in MMCV, you can directly modify the config to use the hook as below

```
custom_hooks = [
    dict(type='MMCVHook', a=a_value, b=b_value, priority='NORMAL')
]
```

12.4.3 Customize self-implemented eval hooks with a dataset

Here we give an example of creating a new hook in MMFewShot and using it to evaluate a dataset. To achieve this, we can add following code in `mmfewshot/classification/apis/test.py`.

```
if validate:
    ...
    # build dataset and dataloader
    my_eval_dataset = build_dataset(cfg.data.my_eval)
    my_eval_data_loader = build_dataloader(my_eval_dataset)
    runner.register_hook(eval_hook(my_eval_data_loader), priority='LOW')
```

The arguments used in `test_my_single_task` can be defined in `meta_test_cfg`, for example:

```
data = dict(
    test=dict(
        type='MetaTestDataset',
        ...,
        dataset=dict(...),
        meta_test_cfg=dict(
            ...,
            test_my_single_task=dict(arg1=...)
        )
    )
)
```

Then we can replace the `test_single_task` with customized `test_my_single_task` in `single_gpu_meta_test` and `multiple_gpu_meta_test`

12.4.4 Modify default runtime hooks

There are some common hooks that are not registered through `custom_hooks`, they are

- `log_config`
- `checkpoint_config`
- `evaluation`
- `lr_config`
- `optimizer_config`
- `momentum_config`

In those hooks, only the logger hook has the `VERY_LOW` priority, others' priority are `NORMAL`. The above-mentioned tutorials already covers how to modify `optimizer_config`, `momentum_config`, and `lr_config`. Here we reveals how what we can do with `log_config`, `checkpoint_config`, and `evaluation`.

Checkpoint config

The MMCV runner will use `checkpoint_config` to initialize `CheckpointHook`.

```
checkpoint_config = dict(interval=1)
```

The users could set `max_keep_ckpts` to only save only small number of checkpoints or decide whether to store state dict of optimizer by `save_optimizer`. More details of the arguments are [here](#)

Log config

The `log_config` wraps multiple logger hooks and enables to set intervals. Now MMCV supports `WandbLoggerHook`, `MlflowLoggerHook`, and `TensorboardLoggerHook`. The detail usages can be found in the [doc](#).

```
log_config = dict(  
    interval=50,  
    hooks=[  
        dict(type='TextLoggerHook'),  
        dict(type='TensorboardLoggerHook')  
    ]  
)
```

Evaluation config

The config of evaluation will be used to initialize the EvalHook. Except the key `interval`, other arguments such as `metric` will be passed to the `dataset.evaluate()`

```
evaluation = dict(interval=1, metric='bbox')
```

12.5 Customize Meta Testing

We already support two ways to handle the support data, fine-tuning and straight forwarding. To customize the code for a meta test task, we need to add a new function `test_my_single_task` in the `mmfewshot/classification/apis/test.py`.

```
def test_my_single_task(model: MetaTestParallel,
                        support_dataloader: DataLoader,
                        query_dataloader: DataLoader,
                        meta_test_cfg: Dict):
    # use copy of model for each task
    model = copy.deepcopy(model)
    ...
    # forward support set
    model.before_forward_support()
    # customize code for support data
    ...

    # forward query set
    model.before_forward_query()
    ...
    results_list, gt_label_list = [], []
    # customize code for query data
    ...

    # return predict results and gt labels for evaluation
    return results_list, gt_labels
```

The arguments used in `test_my_single_task` can be defined in `meta_test_cfg`, for example:

```
data = dict(
    test=dict(
        type='MetaTestDataset',
        ...,
        dataset=dict(...),
```

(下页继续)

(续上页)

```
meta_test_cfg=dict(  
    ...,  
    test_my_single_task=dict(arg1=...)  
)  
)  
)
```

Then we can replace the `test_single_task` with customized `test_my_single_task` in `single_gpu_meta_test` and `multiple_gpu_meta_test`

Tutorial 0: Overview of MMFewShot Detection

The main difference between general classification task and few shot classification task is the data usage. Therefore, the design of MMFewShot targets at data flows for few shot setting based on `mmdet`. Additionally, the modules in `mmdet` can be imported and reused in the code or config.

13.1 Design of data flow

Since MMFewShot is built upon the `mmdet`, all the datasets in `mmdet` can be configured in the config file. If user want to use the dataset from `mmdet`, please refer to `mmdet` for more details.

In MMFewShot, there are three important components for fetching data:

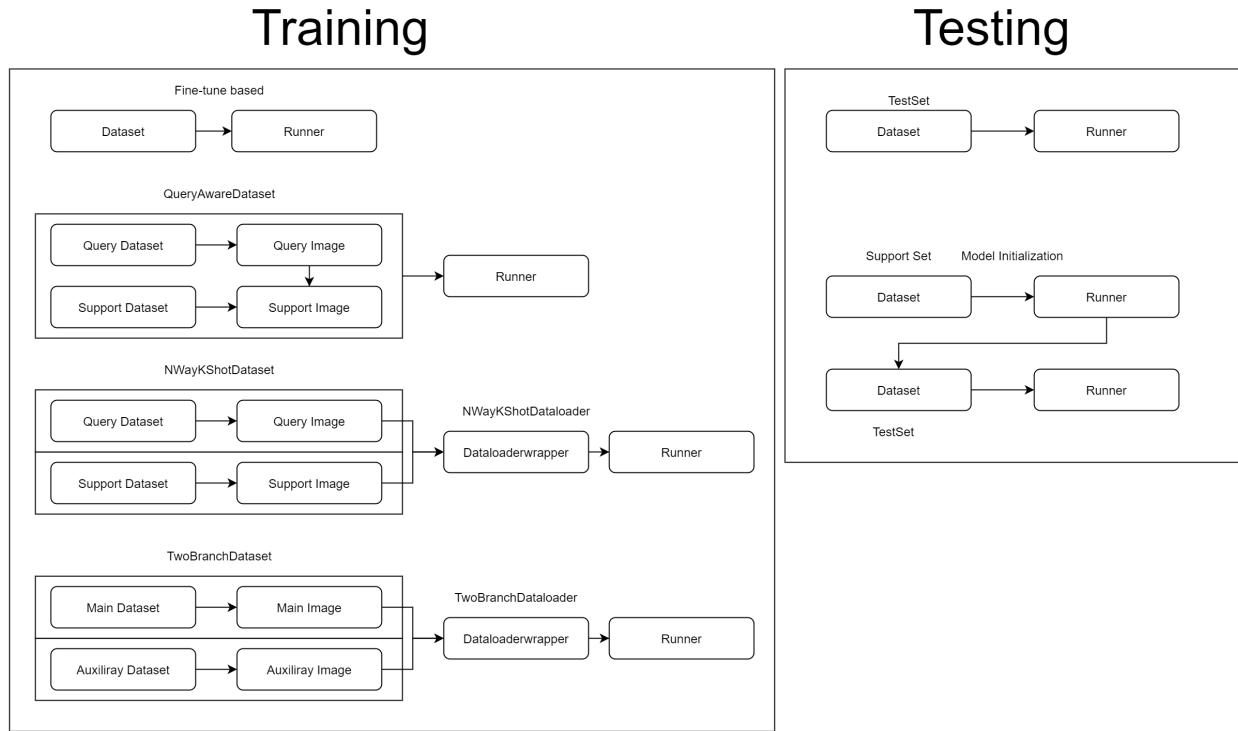

- Datasets: loading annotations from `ann_cfg` and filtering images and annotations for few shot setting.
- Dataset Wrappers: determining the sampling logic, such as sampling support images according to query image.
- Dataloader Wrappers: encapsulate the data from multiple datasets.

In summary, we currently support 4 different data flow for training:

- fine-tune based: it is the same as regular detection.
- query aware: it will return query data and support data from same dataset.
- n way k shot: it will first sample query data (regular) and support data (N way k shot) from separate datasets and then encapsulate them by dataloader wrapper.
- two branch: it will first sample main data (regular) and auxiliary data (regular) from separate datasets and then encapsulate them by dataloader wrapper.

For testing:

- regular testing: it is the same as regular detection.
- testing for query-support based detector: there will be a model initialization step before testing, it is implemented by `QuerySupportEvalHook`. More implementation details can refer to `mmfewshot.detection.core.evaluation.eval_hooks`

More usage details and customization can refer to [Tutorial 2: Adding New Dataset](#)

Tutorial 1: Learn about Configs

We incorporate modular and inheritance design into our config system, which is convenient to conduct various experiments. If you wish to inspect the config file, you may run `python tools/misc/print_config.py /PATH/TO/CONFIG` to see the complete config. The detection part of `mmfewshot` is built upon the `mmdet`, thus it is highly recommended learning the basic of `mmdet`.

14.1 Modify a config through script arguments

When submitting jobs using “`tools/train.py`” or “`tools/test.py`”, you may specify `--cfg-options` to in-place modify the config.

- Update config keys of dict chains.

The config options can be specified following the order of the dict keys in the original config. For example, `--cfg-options model.backbone.norm_eval=False` changes the all BN modules in model backbones to `train` mode.

- Update keys inside a list of configs.

Some config dicts are composed as a list in your config. For example, the training pipeline `data.train.pipeline` is normally a list e.g. `[dict(type='LoadImageFromFile'), ...]`. If you want to change `'LoadImageFromFile'` to `'LoadImageFromWebcam'` in the pipeline, you may specify `--cfg-options data.train.pipeline.0.type=LoadImageFromWebcam`.

- Update values of list/tuples.

If the value to be updated is a list or a tuple. For example, the config file normally sets `workflow=[('train', 1)]`. If you want to change this key, you may specify `--cfg-options workflow="[(train, 1), (val, 1)]"`. Note that the quotation mark " is necessary to support list/tuple data types, and that **NO** white space is allowed inside the quotation marks in the specified value.

14.2 Config File Naming Convention

We follow the below style to name config files. Contributors are advised to follow the same style.

```
{model}_{model setting}_{backbone}_{neck}_{norm setting}_{misc}_{gpu x batch_per_gpu}_
↪{dataset}_{data setting}
```

{xxx} is required field and [yyy] is optional.

- {model}: model type like `faster_rcnn`, `mask_rcnn`, etc.
- [model setting]: specific setting for some model, like `contrastive-loss` for `fsce`, etc.
- {backbone}: backbone type like `r50` (ResNet-50), `x101` (ResNeXt-101).
- {neck}: neck type like `fpn`, `c4`.
- [norm_setting]: `bn` (Batch Normalization) is used unless specified, other norm layer type could be `gn` (Group Normalization), `syncbn` (Synchronized Batch Normalization). `gn-head/gn-neck` indicates GN is applied in head/neck only, while `gn-all` means GN is applied in the entire model, e.g. backbone, neck, head.
- [misc]: miscellaneous setting/plugins of model, e.g. `dconv`, `gcb`, `attention`, `albu`, `mstrain`.
- [gpu x batch_per_gpu]: GPUs and samples per GPU, `8xb2` is used by default.
- {dataset}: dataset like `coco`, `voc-split1`, `voc-split2` and `voc-split3`.
- {data setting}: like `base-training` or `1shot-fine-tuning`.

14.3 An Example of TFA

To help the users have a basic idea of a complete config and the modules in a modern classification system, we make brief comments on the config of TFA in coco 10 shot fine-tuning setting as the following. For more detailed usage and the corresponding alternative for each module, please refer to the API documentation.

```
train_pipeline = [ # Training pipeline
    # First pipeline to load images from file path
    dict(type='LoadImageFromFile'),
    # Second pipeline to load annotations for current image
    dict(type='LoadAnnotations', with_bbox=True),
    # Augmentation pipeline that resize the images and their annotations
```

(下页继续)

(续上页)

```

dict(type='Resize',
    # The multiple scales of image
    img_scale=[(1333, 640), (1333, 672), (1333, 704), (1333, 736),
               (1333, 768), (1333, 800)],
    # whether to keep the ratio between height and width
    keep_ratio=True,
    # the scales will be sampled from img_scale
    multiscale_mode='value'),
# RandomFlip config, flip_ratio: the ratio or probability to flip
dict(type='RandomFlip', flip_ratio=0.5),
# Image normalization config to normalize the input images
dict(type='Normalize',
    # Mean values used to in pre-trained backbone models
    mean=[103.53, 116.28, 123.675],
    # Standard variance used to in pre-trained backbone models
    std=[1.0, 1.0, 1.0],
    # The channel orders of image used in pre-trained backbone models
    to_rgb=False),
# Padding config, size_divisor: the number the padded images should be divisible
dict(type='Pad', size_divisor=32),
# Default format bundle to gather data in the pipeline
dict(type='DefaultFormatBundle'),
# Pipeline that decides which keys in the data should be passed to the detector
dict(type='Collect', keys=['img', 'gt_bboxes', 'gt_labels'])
]
test_pipeline = [ # test pipeline
    # First pipeline to load images from file path
    dict(type='LoadImageFromFile'),
    # An encapsulation that encapsulates the testing augmentations
    dict(type='MultiScaleFlipAug',
        # Decides the largest scale for testing, used for the Resize pipeline
        img_scale=(1333, 800),
        flip=False, # Whether to flip images during testing
        transforms=[
            # Use resize augmentation
            dict(type='Resize', keep_ratio=True),
            # Augmentation pipeline that flip the images and their annotations
            dict(type='RandomFlip'),
            # Augmentation pipeline that normalize the input images
            dict(type='Normalize',
                # Mean values used in pre-trained backbone models
                mean=[103.53, 116.28, 123.675],
                # Standard variance used in pre-trained backbone models

```

(下页继续)

```

        std=[1.0, 1.0, 1.0],
        # The channel orders of image used in pre-trained backbone models
        to_rgb=False),
    # Padding config, size_divisor: the number the padded images should be
    ↪divisible
    dict(type='Pad', size_divisor=32),
    # Default format bundle to gather data in the pipeline
    dict(type='ImageToTensor', keys=['img']),
    # Pipeline that decides which keys in the data should be passed to the
    ↪detector
    dict(type='Collect', keys=['img'])
    ])
]
data = dict(
    # Batch size of a single GPU
    samples_per_gpu=2,
    # Worker to pre-fetch data for each single GPU
    workers_per_gpu=2,
    train=dict( # Train dataset config
        save_dataset=False, # whether to save data_information into json file
        # the pre-defined few shot setting are saved in `FewShotCocoDefaultDataset`
        type='FewShotCocoDefaultDataset',
        ann_cfg=[dict(method='TFA', setting='10SHOT')], # pre-defined few shot
    ↪setting

```

14.4 FAQ

14.4.1 Use intermediate variables in configs

Some intermediate variables are used in the configs files, like `train_pipeline/test_pipeline` in datasets. It's worth noting that when modifying intermediate variables in the children configs, user need to pass the intermediate variables into corresponding fields again. For example, we would like to use multi scale strategy to train a Mask R-CNN. `train_pipeline/test_pipeline` are intermediate variable we would like modify.

```

_base_ = './faster_rcnn_r50_caffe_fpn.py'
img_norm_cfg = dict(
    mean=[123.675, 116.28, 103.53], std=[58.395, 57.12, 57.375], to_rgb=True)
train_pipeline = [
    dict(type='LoadImageFromFile'),
    dict(type='LoadAnnotations', with_bbox=True, with_mask=True),
    dict(

```

(续上页)

```

        type='Resize',
        img_scale=[(1333, 640), (1333, 672), (1333, 704), (1333, 736),
                   (1333, 768), (1333, 800)],
        multiscale_mode="value",
        keep_ratio=True),
    dict(type='RandomFlip', flip_ratio=0.5),
    dict(type='Normalize', **img_norm_cfg),
    dict(type='Pad', size_divisor=32),
    dict(type='DefaultFormatBundle'),
    dict(type='Collect', keys=['img', 'gt_bboxes', 'gt_labels', 'gt_masks']),
]
test_pipeline = [
    dict(type='LoadImageFromFile'),
    dict(
        type='MultiScaleFlipAug',
        img_scale=(1333, 800),
        flip=False,
        transforms=[
            dict(type='Resize', keep_ratio=True),
            dict(type='RandomFlip'),
            dict(type='Normalize', **img_norm_cfg),
            dict(type='Pad', size_divisor=32),
            dict(type='ImageToTensor', keys=['img']),
            dict(type='Collect', keys=['img']),
        ])
]
data = dict(
    train=dict(pipeline=train_pipeline),
    val=dict(pipeline=test_pipeline),
    test=dict(pipeline=test_pipeline))

```

We first define the new `train_pipeline/test_pipeline` and pass them into `data`.

Similarly, if we would like to switch from `SyncBN` to `BN` or `MMSyncBN`, we need to substitute every `norm_cfg` in the `config`.

```

_base_ = './faster_rcnn_r50_caffe_fpn.py'
norm_cfg = dict(type='BN', requires_grad=True)
model = dict(
    backbone=dict(norm_cfg=norm_cfg),
    neck=dict(norm_cfg=norm_cfg),
    ...)

```

Tutorial 2: Adding New Dataset

15.1 Customize Dataset

15.1.1 Load annotations from file

Different from the config in mmdet using `ann_file` to load a single dataset, we use `ann_cfg` to support the complex few shot setting.

The `ann_cfg` is a list of dict and support two type of file:

- loading annotation from the regular `ann_file` of dataset.

```
ann_cfg = [dict(type='ann_file', ann_file='path/to/ann_file'), ...]
```

For `FewShotVOCDataset`, we also support load specific class from `ann_file` in `ann_classes`.

```
dict(type='ann_file', ann_file='path/to/ann_file', ann_classes=['dog', 'cat'])
```

- loading annotation from a json file saved by a dataset.

```
ann_cfg = [dict(type='saved_dataset', ann_file='path/to/ann_file'), ...]
```

To save a dataset, we can set the `save_dataset=True` in config file, and the dataset will be saved as `${WORK_DIR}/{TIMESTAMP}_saved_data.json`

```
dataset=dict(type='FewShotVOCDataset', save_dataset=True, ...)
```

15.1.2 Load annotations from predefined benchmark

Unlike few shot classification can test on thousands of tasks in a short time, it is hard to follow the same protocol in few shot detection because of the computation cost. Thus, we provide the predefined data split for reproducibility. These data splits directly use the files released from TFA [repo](#). The details of data preparation can refer to [here](#).

To load these predefined data splits, the type of dataset need to be set to `FewShotVOCDefaultDataset` or `FewShotCocoDefaultDataset`. We provide data splits of each reproduced checkpoint for each method. In config file, we can use `method` and `setting` to determine which data split to load.

Here is an example of config:

```
dataset = dict(
    type='FewShotVOCDefaultDataset',
    ann_cfg=[dict(method='TFA', setting='SPLIT1_1SHOT')]
)
```

15.1.3 Load annotations from another dataset during runtime

In few shot setting, we can use `FewShotVOCopyDataset` or `FewShotCocoCopyDataset` to copy a dataset from other dataset during runtime for some special cases, such as copying online random sampled support set for model initialization before evaluation. It needs user to modify code in `mmfewshot.detection.apis`. More details can refer to `mmfewshot/detection/apis/train.py`. Here is an example of config:

```
dataset = dict(
    type='FewShotVOCopyDataset',
    ann_cfg=[dict(data_infos=FewShotVOCDataset.data_infos)]
)
```

15.1.4 Use predefined class splits

The predefined class splits are supported in datasets. For VOC, we support [ALL_CLASSES_SPLIT1, ALL_CLASSES_SPLIT2, ALL_CLASSES_SPLIT3, NOVEL_CLASSES_SPLIT1, NOVEL_CLASSES_SPLIT2, NOVEL_CLASSES_SPLIT3, BASE_CLASSES_SPLIT1, BASE_CLASSES_SPLIT2, BASE_CLASSES_SPLIT3]. For COCO, we support [ALL_CLASSES, NOVEL_CLASSES, BASE_CLASSES]

Here is an example of config:

```
data = dict(
    train=dict(type='FewShotVOCDataset', classes='ALL_CLASSES_SPLIT1'),
    val=dict(type='FewShotVOCDataset', classes='ALL_CLASSES_SPLIT1'),
    test=dict(type='FewShotVOCDataset', classes='ALL_CLASSES_SPLIT1'))
```

Also, the class splits can be used to report the evaluation results on different class splits. Here is an example of config:

```
evaluation = dict(class_splits=['BASE_CLASSES_SPLIT1', 'NOVEL_CLASSES_SPLIT1'])
```

15.1.5 Customize the number of annotations

For FewShotDataset, we support two ways to filter extra annotations.

- `ann_shot_filter`: use a dict to specify the class, and the corresponding maximum number of instances when loading the annotation file. For example, we only want 10 instances of dog and 5 instances of person, while other instances from other classes remain unchanged:

```
dataset=dict(type='FewShotVOCDataset',
            ann_shot_filter=dict(dog=10, person=5),
            ...)
```

- `num_novel_shots` and `num_base_shots`: use predefined class splits to indicate the corresponding maximum number of instances. For example, we only want 1 instance for each novel class and 3 instances for base class:

```
dataset=dict(
    type='FewShotVOCDataset',
    num_novel_shots=1,
    num_base_shots=2,
    ...)
```

15.1.6 Customize the organization of annotations

We also support to split the annotation into instance wise, i.e. each image only have one instance, and the images can be repeated.

```
dataset=dict(
    type='FewShotVOCDataset',
    instance_wise=True,
    ...)
```

15.1.7 Customize pipeline

To support different pipelines in single dataset, we can use `multi_pipelines`. In config file, `multi_pipelines` use the name of keys to indicate specific pipelines. Here is an example of config:

```
multi_pipelines = dict(
    query=[
        dict(type='LoadImageFromFile'),
        dict(type='LoadAnnotations', with_bbox=True),
        dict(type='Resize', img_scale=(1000, 600), keep_ratio=True),
        dict(type='RandomFlip', flip_ratio=0.5),
        dict(type='Normalize', **img_norm_cfg),
        dict(type='DefaultFormatBundle'),
        dict(type='Collect', keys=['img', 'gt_bboxes', 'gt_labels'])
    ],
    support=[
        dict(type='LoadImageFromFile'),
        dict(type='LoadAnnotations', with_bbox=True),
        dict(type='Normalize', **img_norm_cfg),
        dict(type='GenerateMask', target_size=(224, 224)),
        dict(type='RandomFlip', flip_ratio=0.0),
        dict(type='DefaultFormatBundle'),
        dict(type='Collect', keys=['img', 'gt_bboxes', 'gt_labels'])
    ]
)
train=dict(
    type='NWayKShotDataset',
    dataset=dict(
        type='FewShotCocoDataset',
        ...
        multi_pipelines=train_multi_pipelines))
```

When `multi_pipelines` is used, we need to specify the pipeline names in `prepare_train_img` to fetch the image. For example

```
dataset.prepare_train_img(self, idx, 'query')
```

15.2 Customize Dataset Wrapper

In few shot setting, the various sampling logic is implemented by dataset wrapper. An example of customizing query-support data sampling logic for training:

15.2.1 Create a new dataset wrapper

We can create a new dataset wrapper in `mmfewshot/detection/datasets/dataset_wrappers.py` to customize sampling logic.

```
class MyDatasetWrapper:
    def __init__(self, dataset, support_dataset=None, args_a, args_b, ...):
        # query_dataset and support_dataset can use same dataset
        self.query_dataset = dataset
        self.support_dataset = support_dataset
        if support_dataset is None:
            self.support_dataset = dataset
        ...

    def __getitem__(self, idx):
        ...
        query_data = self.query_dataset.prepare_train_img(idx, 'query')
        # customize sampling logic
        support_idxes = ...
        support_data = [
            self.support_dataset.prepare_train_img(idx, 'support')
            for idx in support_idxes
        ]
        return {'query_data': query_data, 'support_data': support_data}
```

15.2.2 Update dataset builder

We need to add the building code in `mmfewshot/detection/datasets/builder.py` for our customize dataset wrapper.

```
def build_dataset(cfg, default_args=None):
    if isinstance(cfg, (list, tuple)):
        dataset = ConcatDataset([build_dataset(c, default_args) for c in cfg])
        ...
    elif cfg['type'] == 'MyDatasetWrapper':
        dataset = MyDatasetWrapper(
            build_dataset(cfg['dataset'], default_args),
            build_dataset(cfg['support_dataset'], default_args) if cfg.get('support_
↪dataset', False) else None,
            # pass customize arguments
            args_a=cfg['args_a'],
            args_b=cfg['args_b'],
            ...)
    else:
        dataset = build_from_cfg(cfg, DATASETS, default_args)
```

(下页继续)

```
return dataset
```

15.2.3 Update dataloader builder

We need to add the building code of dataloader in `mmfewshot/detection/datasets/builder.py`, when the customize dataset wrapper will return list of Tensor. We can use `multi_pipeline_collate_fn` to handle this case.

```
def build_dataset(cfg, default_args=None):
    ...
    if isinstance(dataset, MyDatasetWrapper):
        from mmfewshot.utils import multi_pipeline_collate_fn
        # `multi_pipeline_collate_fn` are designed to handle
        # the data with list[list[DataContainer]]
        data_loader = DataLoader(
            dataset,
            batch_size=batch_size,
            sampler=sampler,
            num_workers=num_workers,
            collate_fn=partial(
                multi_pipeline_collate_fn, samples_per_gpu=samples_per_gpu),
            pin_memory=False,
            worker_init_fn=init_fn,
            **kwargs)
    ...
```

15.2.4 Update the arguments in model

The argument names in forward function need to be consistent with the customize dataset wrapper.

```
class MyDetector(BaseDetector):
    ...
    def forward(self, query_data, support_data, ...):
        ...
```

15.2.5 using customize dataset wrapper in config

Then in the config, to use MyDatasetWrapper you can modify the config as the following,

```
dataset_A_train = dict(
    type='MyDatasetWrapper',
    args_a=None,
    args_b=None,
    dataset=dict( # This is the original config of Dataset_A
        type='Dataset_A',
        ...
        multi_pipelines=train_multi_pipelines
    ),
    support_dataset=None
)
```

15.3 Customize Dataloader Wrapper

We also support to iterate two different dataset simultaneously by dataloader wrapper.

An example of customizing dataloader wrapper for query and support dataset:

15.3.1 Create a new dataloader wrapper

We can create a new dataset wrapper in mmfewshot/detection/datasets/dataloader_wrappers.py to customize sampling logic.

```
class MyDataloader:
    def __init__(self, query_data_loader, support_data_loader):
        self.dataset = query_data_loader.dataset
        self.sampler = query_data_loader.sampler
        self.query_data_loader = query_data_loader
        self.support_data_loader = support_data_loader

    def __iter__(self):
        self.query_iter = iter(self.query_data_loader)
        self.support_iter = iter(self.support_data_loader)
        return self

    def __next__(self):
        query_data = self.query_iter.next()
        support_data = self.support_iter.next()
        return {'query_data': query_data, 'support_data': support_data}
```

(下页继续)

```
def __len__(self) -> int:
    return len(self.query_data_loader)
```

15.3.2 Update dataloader builder

We need to add the build code in `mmfewshot/detection/datasets/builder.py` for our customize dataset wrapper.

```
def build_dataloader(dataset, ...):
    if isinstance(dataset, MyDataset):
        ...
        query_data_loader = DataLoader(...)
        support_data_loader = DataLoader(...)
        # wrap two dataloaders with dataloader wrapper
        data_loader = MyDataloader(
            query_data_loader=query_data_loader,
            support_data_loader=support_data_loader)

    return dataset
```

Tutorial 3: Customize Models

We basically categorize model components into 5 types the same as mmdet.

- backbone: usually an FCN network to extract feature maps, e.g., ResNet, MobileNet.
- neck: the component between backbones and heads, e.g., FPN, PAFPN.
- head: the component for specific tasks, e.g., bbox prediction and mask prediction.
- roi extractor: the part for extracting RoI features from feature maps, e.g., RoI Align.
- loss: the component in head for calculating losses, e.g., FocalLoss, L1Loss, and GHMLoss.

16.1 Develop new components

16.1.1 Add a new detector

Here we show how to develop new components with an example.

16.1.2 Add a new backbone

Here we show how to develop new components with an example of MobileNet.

1. Define a new backbone (e.g. MobileNet)

Create a new file `mmfewshot/detection/models/backbones/mobilenet.py`.

```
import torch.nn as nn

from ..builder import BACKBONES

@BACKBONES.register_module()
class MobileNet(nn.Module):

    def __init__(self, arg1, arg2):
        pass

    def forward(self, x): # should return a tuple
        pass
```

2. Import the module

You can either add the following line to `mmfewshot/detection/models/backbones/__init__.py`

```
from .mobilenet import MobileNet
```

or alternatively add

```
custom_imports = dict(
    imports=['mmfewshot.detection.models.backbones.mobilenet'],
    allow_failed_imports=False)
```

to the config file to avoid modifying the original code.

3. Use the backbone in your config file

```
model = dict(
    ...
    backbone=dict(
        type='MobileNet',
        arg1=xxx,
        arg2=xxx),
    ...
```

16.1.3 Add new necks

1. Define a neck (e.g. PAFPN)

Create a new file `mmfewshot/detection/models/necks/pafpn.py`.

```
from ..builder import NECKS

@NECKS.register_module()
class PAFPN(nn.Module):

    def __init__(self,
                 in_channels,
                 out_channels,
                 num_outs,
                 start_level=0,
                 end_level=-1,
                 add_extra_convs=False):
        pass

    def forward(self, inputs):
        # implementation is ignored
        pass
```

2. Import the module

You can either add the following line to `mmfewshot/detection/models/necks/__init__.py`,

```
from .pafpn import PAFPN
```

or alternatively add

```

custom_imports = dict(
    imports=['mmdet.models.necks.pafpn.py'],
    allow_failed_imports=False)

```

to the config file and avoid modifying the original code.

3. Modify the config file

```

neck=dict(
    type='PAFPN',
    in_channels=[256, 512, 1024, 2048],
    out_channels=256,
    num_outs=5)

```

16.1.4 Add new heads

Here we show how to develop a new head with the example of [Double Head R-CNN](#) as the following.

First, add a new bbox head in `mmfeshot/detection/models/roi_heads/bbox_heads/double_bbox_head.py`. Double Head R-CNN implements a new bbox head for object detection. To implement a bbox head, basically we need to implement three functions of the new module as the following.

```

from mmdet.models.builder import HEADS
from .bbox_head import BBoxHead

@HEADS.register_module()
class DoubleConvFCBBoxHead(BBoxHead):
    """Bbox head used in Double-Head R-CNN

    .. code-block:: text
        :caption: Diagram of DoubleConvFCBBoxHead structure
        :width: 100%
        :text-align: center;
        :font-family: monospace;
        :font-size: 0.8em;
        :padding: 10px 0;

        graph TD
            A[roi features] --> B[conv]
            B --> C[conv]
            C --> D[fc]
            D --> E[reg]
            B --> F[cls]
            C --> G[cls]
            D --> H[reg]

            subgraph " "
                direction LR
                B --- C --- D
            end

            subgraph " "
                direction LR
                F --- G --- H
            end

            style B fill:none,stroke:none
            style C fill:none,stroke:none
            style D fill:none,stroke:none
            style F fill:none,stroke:none
            style G fill:none,stroke:none
            style H fill:none,stroke:none
    """
    # noqa: W605

    def __init__(self,
                 num_convs=0,
                 num_fcs=0,
                 conv_out_channels=1024,

```

(下页继续)

(续上页)

```

        fc_out_channels=1024,
        conv_cfg=None,
        norm_cfg=dict(type='BN'),
        **kwargs):
    kwargs.setdefault('with_avg_pool', True)
    super(DoubleConvFCBBoxHead, self).__init__(**kwargs)

    def forward(self, x_cls, x_reg):

```

Second, implement a new RoI Head if it is necessary. We plan to inherit the new DoubleHeadRoIHead from StandardRoIHead. We can find that a StandardRoIHead already implements the following functions.

```

import torch

from mmdet.core import bbox2result, bbox2roi, build_assigner, build_sampler
from ..builder import HEADS, build_head, build_roi_extractor
from .base_roi_head import BaseRoIHead
from .test_mixins import BBoxTestMixin, MaskTestMixin

@HEADS.register_module()
class StandardRoIHead(BaseRoIHead, BBoxTestMixin, MaskTestMixin):
    """Simplest base roi head including one bbox head and one mask head.
    """

    def init_assigner_sampler(self):

    def init_bbox_head(self, bbox_roi_extractor, bbox_head):

    def init_mask_head(self, mask_roi_extractor, mask_head):

    def forward_dummy(self, x, proposals):

    def forward_train(self,
                      x,
                      img_metas,
                      proposal_list,
                      gt_bboxes,
                      gt_labels,
                      gt_bboxes_ignore=None,

```

(下页继续)

```

        gt_masks=None):

    def _bbox_forward(self, x, rois):

    def _bbox_forward_train(self, x, sampling_results, gt_bboxes, gt_labels,
                             img_metas):

    def _mask_forward_train(self, x, sampling_results, bbox_feats, gt_masks,
                             img_metas):

    def _mask_forward(self, x, rois=None, pos_inds=None, bbox_feats=None):

    def simple_test(self,
                    x,
                    proposal_list,
                    img_metas,
                    proposals=None,
                    rescale=False):
        """Test without augmentation."""

```

Double Head's modification is mainly in the `bbox_forward` logic, and it inherits other logics from the `StandardRoIHead`. In the `mmfewshot/detection/models/roi_heads/double_roi_head.py`, we implement the new RoI Head as the following:

```

from ..builder import HEADS
from .standard_roi_head import StandardRoIHead

@HEADS.register_module()
class DoubleHeadRoIHead(StandardRoIHead):
    """RoI head for Double Head RCNN

    https://arxiv.org/abs/1904.06493
    """

    def __init__(self, reg_roi_scale_factor, **kwargs):
        super(DoubleHeadRoIHead, self).__init__(**kwargs)
        self.reg_roi_scale_factor = reg_roi_scale_factor

    def _bbox_forward(self, x, rois):
        bbox_cls_feats = self.bbox_roi_extractor(

```

(续上页)

```

        x[:self.bbox_roi_extractor.num_inputs], rois)
bbox_reg_feats = self.bbox_roi_extractor(
    x[:self.bbox_roi_extractor.num_inputs],
    rois,
    roi_scale_factor=self.reg_roi_scale_factor)
if self.with_shared_head:
    bbox_cls_feats = self.shared_head(bbox_cls_feats)
    bbox_reg_feats = self.shared_head(bbox_reg_feats)
cls_score, bbox_pred = self.bbox_head(bbox_cls_feats, bbox_reg_feats)

bbox_results = dict(
    cls_score=cls_score,
    bbox_pred=bbox_pred,
    bbox_feats=bbox_cls_feats)
return bbox_results

```

Last, the users need to add the module in `mmfewshot/detection/models/bbox_heads/__init__.py` and `mmfewshot/detection/models/roi_heads/__init__.py` thus the corresponding registry could find and load them.

Alternatively, the users can add

```

custom_imports=dict(
    imports=['mmfewshot.detection.models.roi_heads.double_roi_head', 'mmfewshot.
↪detection.models.bbox_heads.double_bbox_head'])

```

to the config file and achieve the same goal.

The config file of Double Head R-CNN is as the following

```

_base_ = '../faster_rcnn/faster_rcnn_r50_fpn_1x_coco.py'
model = dict(
    roi_head=dict(
        type='DoubleHeadRoIHead',
        reg_roi_scale_factor=1.3,
        bbox_head=dict(
            _delete_=True,
            type='DoubleConvFCBBoxHead',
            num_convs=4,
            num_fcs=2,
            in_channels=256,
            conv_out_channels=1024,
            fc_out_channels=1024,
            roi_feat_size=7,
            num_classes=80,

```

(下页继续)

```

bbox_coder=dict(
    type='DeltaXYWHBBoxCoder',
    target_means=[0., 0., 0., 0.],
    target_stds=[0.1, 0.1, 0.2, 0.2]),
reg_class_agnostic=False,
loss_cls=dict(
    type='CrossEntropyLoss', use_sigmoid=False, loss_weight=2.0),
loss_bbox=dict(type='SmoothL1Loss', beta=1.0, loss_weight=2.0)))

```

Since MMDetection 2.0, the config system supports to inherit configs such that the users can focus on the modification. The Double Head R-CNN mainly uses a new `DoubleHeadRoIHead` and a new `DoubleConvFCBBoxHead`, the arguments are set according to the `__init__` function of each module.

16.1.5 Add new loss

Assume you want to add a new loss as `MyLoss`, for bounding box regression. To add a new loss function, the users need implement it in `mmfewshot/detection/models/losses/my_loss.py`. The decorator `weighted_loss` enable the loss to be weighted for each element.

```

import torch
import torch.nn as nn

from ..builder import LOSSES
from .utils import weighted_loss

@weighted_loss
def my_loss(pred, target):
    assert pred.size() == target.size() and target.numel() > 0
    loss = torch.abs(pred - target)
    return loss

@LOSSES.register_module()
class MyLoss(nn.Module):

    def __init__(self, reduction='mean', loss_weight=1.0):
        super(MyLoss, self).__init__()
        self.reduction = reduction
        self.loss_weight = loss_weight

    def forward(self,
                pred,
                target,

```

(续上页)

```

        weight=None,
        avg_factor=None,
        reduction_override=None):
    assert reduction_override in (None, 'none', 'mean', 'sum')
    reduction = (
        reduction_override if reduction_override else self.reduction)
    loss_bbox = self.loss_weight * my_loss(
        pred, target, weight, reduction=reduction, avg_factor=avg_factor)
    return loss_bbox

```

Then the users need to add it in the mmfewshot/detection/models/losses/__init__.py.

```

from .my_loss import MyLoss, my_loss

```

Alternatively, you can add

```

custom_imports=dict(
    imports=['mmfewshot.detection.models.losses.my_loss'])

```

to the config file and achieve the same goal.

To use it, modify the loss_xxx field. Since MyLoss is for regression, you need to modify the loss_bbox field in the head.

```

loss_bbox=dict(type='MyLoss', loss_weight=1.0))

```

16.2 Customize frozen parameters

We support frozen_parameters to freeze the parameters during training by parameters' prefix. For example, in roi_head if we only want to freeze the shared_fcs in bbox_head, we can add roi_head.bbox_head.shared_fcs into frozen_parameters list.

```

model = dict(
    frozen_parameters=[
        'backbone', 'neck', 'rpn_head', 'roi_head.bbox_head.shared_fcs'
    ])

```

16.3 Customize a query-support based detector

Here we show how to develop a new query-support based detector with the example.

16.3.1 1. Define a new detector

Create a new file `mmfewshot/detection/models/detector/my_detector.py`.

```
@DETECTORS.register_module()
class MyDetector(QuerySupportDetector):
    # customize the input data
    def forward(self, query_data, support_data, img, img metas, mode, **kwargs):
        if mode == 'train':
            return self.forward_train(query_data, support_data, **kwargs)
        elif mode == 'model_init':
            return self.forward_model_init(img, img metas, **kwargs)
        elif mode == 'test':
            return self.forward_test(img, img metas, **kwargs)
        ...

    def forward_train(self, query_data, support_data, proposals, **kwargs):
        ...

    # before testing the model will forward the whole support set
    # customize the forward logic and save all the needed information
    def forward_model_init(self, img, img metas, gt_bboxes, gt_labels):
        ...

    # customize the process logic for the saved information from images
    def model_init(self, **kwargs):
        ...
```

16.3.2 2. Import the module

You can either add the following line to `mmfewshot/detection/models/detectors/__init__.py`

```
from .my_detector import MyDetector
```

or alternatively add

```
custom_imports = dict(
    imports=['mmfewshot.detection.models.detectors.my_detector'],
    allow_failed_imports=False)
```

to the config file to avoid modifying the original code.

16.3.3 3. Use the detector in your config file

```
model = dict(
    type='MyDetector',
    ...
```

16.3.4 Customize an aggregation layer

we also support to reuse the code of feature fusion from different data usually used in query support based methods. Here we show how to develop a new aggregator with the example.

1. Define a new aggregator

Add customize code in `mmfewshot/detection/models/utils/aggregation_layer.py`.

```
@AGGREGATORS.register_module()
class MyAggregator(BaseModule):

    def __init__(self, ...):

    def forward(self, query_feat, support_feat):
        ...
        return feat
```

2. Use the aggregator in your config file

The `aggregation_layer` can build from single aggregator:

```
aggregation_layer = dict(type='MyAggregator',...)
```

or build with multiple aggregators and wrap by a `AggregationLayer`.

```
aggregation_layer = dict(
    type = 'AggregationLayer',
    aggregator_cfgs = [
        dict(type = 'MyAggregator',...),
        ...]
)
```

3. Use the aggregator in your model

```
from mmfewshot.detection.models.utils import build_aggregator
@HEADS.register_module()
class MyHead(...):
    def __init__(self, ..., aggregation_layer):
        self.aggregation_layer = build_aggregator(copy.deepcopy(aggregation_layer))

    def forward_train(self, ...):
        ...
        self.aggregation_layer(query_feat=..., support_feat=...)
        ...
```

Tutorial 4: Customize Runtime Settings

17.1 Customize optimization settings

17.1.1 Customize optimizer supported by Pytorch

We already support to use all the optimizers implemented by PyTorch, and the only modification is to change the `optimizer` field of config files. For example, if you want to use ADAM (note that the performance could drop a lot), the modification could be as the following.

```
optimizer = dict(type='Adam', lr=0.0003, weight_decay=0.0001)
```

To modify the learning rate of the model, the users only need to modify the `lr` in the config of optimizer. The users can directly set arguments following the [API doc](#) of PyTorch.

17.1.2 Customize self-implemented optimizer

1. Define a new optimizer

A customized optimizer could be defined as following.

Assume you want to add a optimizer named `MyOptimizer`, which has arguments `a`, `b`, and `c`. You need to create a new directory named `mmfewshot/detection/core/optimizer`. And then implement the new optimizer in a file, e.g., in `mmfewshot/detection/core/optimizer/my_optimizer.py`:

```

from .registry import OPTIMIZERS
from torch.optim import Optimizer

@OPTIMIZERS.register_module()
class MyOptimizer(Optimizer):

    def __init__(self, a, b, c)

```

2. Add the optimizer to registry

To find the above module defined above, this module should be imported into the main namespace at first. There are two options to achieve it.

- Modify `mmfewshot/detection/core/optimizer/__init__.py` to import it.

The newly defined module should be imported in `mmfewshot/detection/core/optimizer/__init__.py` so that the registry will find the new module and add it:

```

from .my_optimizer import MyOptimizer

```

- Use `custom_imports` in the config to manually import it

```

custom_imports = dict(imports=['mmfewshot.detection.core.optimizer.my_optimizer'], ↵
↵allow_failed_imports=False)

```

The module `mmfewshot.detection.core.optimizer.my_optimizer` will be imported at the beginning of the program and the class `MyOptimizer` is then automatically registered. Note that only the package containing the class `MyOptimizer` should be imported. `mmfewshot.detection.core.optimizer.my_optimizer.MyOptimizer` **cannot** be imported directly.

Actually users can use a totally different file directory structure using this importing method, as long as the module root can be located in `PYTHONPATH`.

3. Specify the optimizer in the config file

Then you can use `MyOptimizer` in `optimizer` field of config files. In the configs, the optimizers are defined by the field `optimizer` like the following:

```

optimizer = dict(type='SGD', lr=0.02, momentum=0.9, weight_decay=0.0001)

```

To use your own optimizer, the field can be changed to

```
optimizer = dict(type='MyOptimizer', a=a_value, b=b_value, c=c_value)
```

17.1.3 Customize optimizer constructor

Some models may have some parameter-specific settings for optimization, e.g. weight decay for BatchNorm layers. The users can do those fine-grained parameter tuning through customizing optimizer constructor.

```
from mmcv.utils import build_from_cfg

from mmcv.runner.optimizer import OPTIMIZER_BUILDERS, OPTIMIZERS
from mmfewshot.utils import get_root_logger
from .my_optimizer import MyOptimizer

@OPTIMIZER_BUILDERS.register_module()
class MyOptimizerConstructor(object):

    def __init__(self, optimizer_cfg, paramwise_cfg=None):

    def __call__(self, model):

        return my_optimizer
```

The default optimizer constructor is implemented [here](#), which could also serve as a template for new optimizer constructor.

17.1.4 Additional settings

Tricks not implemented by the optimizer should be implemented through optimizer constructor (e.g., set parameter-wise learning rates) or hooks. We list some common settings that could stabilize the training or accelerate the training. Feel free to create PR, issue for more settings.

- **Use gradient clip to stabilize training:** Some models need gradient clip to clip the gradients to stabilize the training process. An example is as below:

```
optimizer_config = dict(grad_clip=dict(max_norm=35, norm_type=2))
```

- **Use momentum schedule to accelerate model convergence:** We support momentum scheduler to modify model's momentum according to learning rate, which could make the model converge in a faster way. Momentum scheduler is usually used with LR scheduler, for example, the following config is used in 3D detection to accelerate convergence. For more details, please refer to the implementation of [CyclicLrUpdater](#) and [CyclicMomentumUpdater](#).

```
lr_config = dict(  
    policy='cyclic',  
    target_ratio=(10, 1e-4),  
    cyclic_times=1,  
    step_ratio_up=0.4,  
)  
momentum_config = dict(  
    policy='cyclic',  
    target_ratio=(0.85 / 0.95, 1),  
    cyclic_times=1,  
    step_ratio_up=0.4,  
)
```

17.2 Customize training schedules

By default we use step learning rate with 1x schedule, this calls `StepLRHook` in MMCV. We support many other learning rate schedule [here](#), such as `CosineAnnealing` and `Poly` schedule. Here are some examples

- Poly schedule:

```
lr_config = dict(policy='poly', power=0.9, min_lr=1e-4, by_epoch=False)
```

- CosineAnnealing schedule:

```
lr_config = dict(  
    policy='CosineAnnealing',  
    warmup='linear',  
    warmup_iters=1000,  
    warmup_ratio=1.0 / 10,  
    min_lr_ratio=1e-5)
```

17.3 Customize workflow

Workflow is a list of (phase, epochs) to specify the running order and epochs. By default it is set to be

```
workflow = [('train', 1)]
```

which means running 1 epoch for training. Sometimes user may want to check some metrics (e.g. loss, accuracy) about the model on the validate set. In such case, we can set the workflow as

```
[('train', 1), ('val', 1)]
```

so that 1 epoch for training and 1 epoch for validation will be run iteratively.

Note:

1. The parameters of model will not be updated during val epoch.
2. Keyword `total_epochs` in the config only controls the number of training epochs and will not affect the validation workflow.
3. Workflows `[('train', 1), ('val', 1)]` and `[('train', 1)]` will not change the behavior of `EvalHook` because `EvalHook` is called by `after_train_epoch` and validation workflow only affect hooks that are called through `after_val_epoch`. Therefore, the only difference between `[('train', 1), ('val', 1)]` and `[('train', 1)]` is that the runner will calculate losses on validation set after each training epoch.

17.4 Customize hooks

17.4.1 Customize self-implemented hooks

1. Implement a new hook

Here we give an example of creating a new hook in `MMPose` and using it in training.

```
from mmpcv.runner import HOOKS, Hook

@HOOKS.register_module()
class MyHook(Hook):

    def __init__(self, a, b):
        pass

    def before_run(self, runner):
        pass

    def after_run(self, runner):
        pass

    def before_epoch(self, runner):
        pass

    def after_epoch(self, runner):
        pass
```

(下页继续)

```
def before_iter(self, runner):
    pass

def after_iter(self, runner):
    pass
```

Depending on the functionality of the hook, the users need to specify what the hook will do at each stage of the training in `before_run`, `after_run`, `before_epoch`, `after_epoch`, `before_iter`, and `after_iter`.

2. Register the new hook

Then we need to make `MyHook` imported. Assuming the file is in `mmfewshot/detection/core/utils/my_hook.py` there are two ways to do that:

- Modify `mmfewshot/core/utils/__init__.py` to import it.

The newly defined module should be imported in `mmfewshot/detection/core/utils/__init__.py` so that the registry will find the new module and add it:

```
from .my_hook import MyHook
```

- Use `custom_imports` in the config to manually import it

```
custom_imports = dict(imports=['mmfewshot.detection.core.utils.my_hook'], allow_
↪failed_imports=False)
```

3. Modify the config

```
custom_hooks = [
    dict(type='MyHook', a=a_value, b=b_value)
]
```

You can also set the priority of the hook by adding key `priority` to 'NORMAL' or 'HIGHEST' as below

```
custom_hooks = [
    dict(type='MyHook', a=a_value, b=b_value, priority='NORMAL')
]
```

By default the hook's priority is set as NORMAL during registration.

17.4.2 Use hooks implemented in MMCV

If the hook is already implemented in MMCV, you can directly modify the config to use the hook as below

```
custom_hooks = [  
    dict(type='MMCVHook', a=a_value, b=b_value, priority='NORMAL')  
]
```

17.4.3 Modify default runtime hooks

There are some common hooks that are not registered through `custom_hooks`, they are

- `log_config`
- `checkpoint_config`
- `evaluation`
- `lr_config`
- `optimizer_config`
- `momentum_config`

In those hooks, only the logger hook has the `VERY_LOW` priority, others' priority are `NORMAL`. The above-mentioned tutorials already covers how to modify `optimizer_config`, `momentum_config`, and `lr_config`. Here we reveals how what we can do with `log_config`, `checkpoint_config`, and `evaluation`.

Checkpoint config

The MMCV runner will use `checkpoint_config` to initialize `CheckpointHook`.

```
checkpoint_config = dict(interval=1)
```

The users could set `max_keep_ckpts` to only save only small number of checkpoints or decide whether to store state dict of optimizer by `save_optimizer`. More details of the arguments are [here](#)

Log config

The `log_config` wraps multiple logger hooks and enables to set intervals. Now MMCV supports `WandbLoggerHook`, `MlflowLoggerHook`, and `TensorboardLoggerHook`. The detail usages can be found in the [doc](#).

```
log_config = dict(  
    interval=50,  
    hooks=[
```

(下页继续)

(续上页)

```
dict(type='TextLoggerHook'),  
dict(type='TensorboardLoggerHook')  
])
```

Evaluation config

The config of `evaluation` will be used to initialize the `EvalHook`. Except the key `interval`, other arguments such as `metric` will be passed to the `dataset.evaluate()`

```
evaluation = dict(interval=1, metric='bbox')
```

CHAPTER 18

Changelog

Frequently Asked Questions

We list some common troubles faced by many users and their corresponding solutions here. Feel free to enrich the list if you find any frequent issues and have ways to help others to solve them. If the contents here do not cover your issue, please create an issue using the [provided templates](#) and make sure you fill in all required information in the template.

19.1 MMCV Installation

- Compatibility issue between MMCV and MMDetection; “ConvWS is already registered in conv layer” ; “AssertionError: MMCV==xxx is used but incompatible. Please install mmcv>=xxx, <=xxx.”

Please install the correct version of MMCV for the version of your MMDetection following the [installation instruction](#).

- “No module named ‘mmcv.ops’” ; “No module named ‘mmcv_ext’” .
 1. Uninstall existing mmcv in the environment using `pip uninstall mmcv`.
 2. Install mmcv-full following the [installation instruction](#).

19.2 PyTorch/CUDA Environment

- “RTX 30 series card fails when building MMCV or MMDet”
 1. Temporary work-around: `do MMCV_WITH_OPS=1 MMCV_CUDA_ARGS='-gencode=arch=compute_80,code=sm_80' pip install -e ..`. The common issue is `nvcc fatal : Unsupported gpu architecture 'compute_86'`. This means that the compiler should optimize for `sm_86`, i.e., nvidia 30 series card, but such optimizations have not been supported by CUDA toolkit 11.0. This work-around modifies the compile flag by adding `MMCV_CUDA_ARGS='-gencode=arch=compute_80,code=sm_80'`, which tells `nvcc` to optimize for **sm_80**, i.e., Nvidia A100. Although A100 is different from the 30 series card, they use similar ampere architecture. This may hurt the performance but it works.
 2. PyTorch developers have updated that the default compiler flags should be fixed by [pytorch/pytorch#47585](#). So using PyTorch-nightly may also be able to solve the problem, though we have not tested it yet.
- “invalid device function” or “no kernel image is available for execution” .
 1. Check if your cuda runtime version (under `/usr/local/`), `nvcc --version` and `conda list cudatoolkit` version match.
 2. Run `python mmdet/utils/collect_env.py` to check whether PyTorch, torchvision, and MMCV are built for the correct GPU architecture. You may need to set `TORCH_CUDA_ARCH_LIST` to re-install MMCV. The GPU arch table could be found [here](#), i.e. run `TORCH_CUDA_ARCH_LIST=7.0 pip install mmcv-full` to build MMCV for Volta GPUs. The compatibility issue could happen when using old GPUS, e.g., Tesla K80 (3.7) on colab.
 3. Check whether the running environment is the same as that when `mmcv/mmdet` has compiled. For example, you may compile `mmcv` using CUDA 10.0 but run it on CUDA 9.0 environments.
- “undefined symbol” or “cannot open xxx.so” .
 1. If those symbols are CUDA/C++ symbols (e.g., `libcudart.so` or `GLIBCXX`), check whether the CUDA/GCC runtimes are the same as those used for compiling `mmcv`, i.e. run `python mmdet/utils/collect_env.py` to see if `"MMCV Compiler"/"MMCV CUDA Compiler"` is the same as `"GCC"/"CUDA_HOME"`.
 2. If those symbols are PyTorch symbols (e.g., symbols containing `caffe`, `aten`, and `TH`), check whether the PyTorch version is the same as that used for compiling `mmcv`.
 3. Run `python mmdet/utils/collect_env.py` to check whether PyTorch, torchvision, and MMCV are built by and running on the same environment.
- `setuptools.sandbox.UnpickableException: DistutilsSetupError(“each element of ‘ext_modules’ option must be an Extension instance or 2-tuple”)`
 1. If you are using `miniconda` rather than `anaconda`, check whether `Cython` is installed as indicated in [#3379](#). You need to manually install `Cython` first and then run command `pip install -r requirements.txt`.

2. You may also need to check the compatibility between the `setuptools`, `Cython`, and `PyTorch` in your environment.
- “Segmentation fault” .
 1. Check you GCC version and use GCC 5.4. This usually caused by the incompatibility between `PyTorch` and the environment (e.g., `GCC < 4.9` for `PyTorch`). We also recommend the users to avoid using `GCC 5.5` because many feedbacks report that `GCC 5.5` will cause “segmentation fault” and simply changing it to `GCC 5.4` could solve the problem.
 2. Check whether `PyTorch` is correctly installed and could use `CUDA` op, e.g. type the following command in your terminal.

```
python -c 'import torch; print(torch.cuda.is_available())'
```

And see whether they could correctly output results.

3. If `Pytorch` is correctly installed, check whether `MMCV` is correctly installed.

```
python -c 'import mmcv; import mmcv.ops'
```

If `MMCV` is correctly installed, then there will be no issue of the above two commands.

4. If `MMCV` and `Pytorch` is correctly installed, you can use `ipdb`, `pdb` to set breakpoints or directly add ‘print’ in `mmdetection` code and see which part leads the segmentation fault.

19.3 Training

- “Loss goes Nan”
 1. Check if the dataset annotations are valid: zero-size bounding boxes will cause the regression loss to be `Nan` due to the commonly used transformation for box regression. Some small size (width or height are smaller than 1) boxes will also cause this problem after data augmentation (e.g., `instaboost`). So check the data and try to filter out those zero-size boxes and skip some risky augmentations on the small-size boxes when you face the problem.
 2. Reduce the learning rate: the learning rate might be too large due to some reasons, e.g., change of batch size. You can rescale them to the value that could stably train the model.
 3. Extend the warmup iterations: some models are sensitive to the learning rate at the start of the training. You can extend the warmup iterations, e.g., change the `warmup_iters` from 500 to 1000 or 2000.
 4. Add gradient clipping: some models requires gradient clipping to stabilize the training process. The default of `grad_clip` is `None`, you can add gradient clipping to avoid gradients that are too large, i.e., set `optimizer_config=dict(_delete_=True, grad_clip=dict(max_norm=35, norm_type=2))` in your config file. If your config does not inherits from any basic con-

fig that contains `optimizer_config=dict(grad_clip=None)`, you can simply add `optimizer_config=dict(grad_clip=dict(max_norm=35, norm_type=2))`.

- ‘GPU out of memory’
 1. There are some scenarios when there are large amounts of ground truth boxes, which may cause OOM during target assignment. You can set `gpu_assign_thr=N` in the config of assigner thus the assigner will calculate box overlaps through CPU when there are more than N GT boxes.
 2. Set `with_cp=True` in the backbone. This uses the sublinear strategy in PyTorch to reduce GPU memory cost in the backbone.
 3. Try mixed precision training using following the examples in `config/fp16`. The `loss_scale` might need further tuning for different models.
- “RuntimeError: Expected to have finished reduction in the prior iteration before starting a new one”
 1. This error indicates that your module has parameters that were not used in producing loss. This phenomenon may be caused by running different branches in your code in DDP mode.
 2. You can set `find_unused_parameters = True` in the config to solve the above problems or find those unused parameters manually.

19.4 Evaluation

- COCO Dataset, AP or AR = -1
 1. According to the definition of COCO dataset, the small and medium areas in an image are less than 1024 (32*32), 9216 (96*96), respectively.
 2. If the corresponding area has no object, the result of AP and AR will set to -1.

CHAPTER 20

English

CHAPTER 21

简体中文

22.1 classification.apis

`mmfewshot.classification.apis.inference_classifier` (*model*: `torch.nn.modules.module.Module`,
query_img: `str`) → Dict

Inference single image with the classifier.

参数

- **model** (`nn.Module`) –The loaded classifier.
- **query_img** (`str`) –The image filename.

返回

The classification results that contains *pred_score* of each class.

返回类型 dict

`mmfewshot.classification.apis.init_classifier` (*config*: `Union[str, mmcv.utils.config.Config]`,
checkpoint: `Optional[str] = None`, *device*: `str = 'cuda:0'`, *options*: `Optional[Dict] = None`) →
`torch.nn.modules.module.Module`

Prepare a few shot classifier from config file.

参数

- **config** (`str` or `mmcv.Config`) –Config file path or the config object.

- **checkpoint** (*str* | *None*) –Checkpoint path. If left as *None*, the model will not load any weights. Default: *None*.
- **device** (*str*) –Runtime device. Default: ‘*cuda:0*’ .
- **options** (*dict* | *None*) –Options to override some settings in the used config. Default: *None*.

返回 The constructed classifier.

返回类型 `nn.Module`

```
mmfewshot.classification.apis.multi_gpu_meta_test (model:
                                                    mmcv.parallel.distributed.MMDistributedDataParallel,
                                                    num_test_tasks: int, support_data_loader:
                                                    torch.utils.data.dataloader.DataLoader,
                                                    query_data_loader:
                                                    torch.utils.data.dataloader.DataLoader,
                                                    test_set_data_loader: Op-
                                                    tional[torch.utils.data.dataloader.DataLoader]
                                                    = None, meta_test_cfg: Optional[Dict] =
                                                    None, eval_kwargs: Optional[Dict] =
                                                    None, logger: Optional[object] = None,
                                                    confidence_interval: float = 0.95,
                                                    show_task_results: bool = False) → Dict
```

Distributed meta testing on multiple gpus.

During meta testing, model might be further fine-tuned or added extra parameters. While the tested model need to be restored after meta testing since meta testing can be used as the validation in the middle of training. To detach model from previous phase, the model will be copied and wrapped with `MetaTestParallel`. And it has full independence from the training model and will be discarded after the meta testing.

In the distributed situation, the `MetaTestParallel` on each GPU is also independent. The test tasks in few shot leaning usually are very small and hardly benefit from distributed acceleration. Thus, in distributed meta testing, each task is done in single GPU and each GPU is assigned a certain number of tasks. The number of test tasks for each GPU is `ceil(num_test_tasks / world_size)`. After all GPUs finish their tasks, the results will be aggregated to get the final result.

参数

- **model** (`MMDistributedDataParallel`) –Model to be meta tested.
- **num_test_tasks** (*int*) –Number of meta testing tasks.
- **support_data_loader** (`DataLoader`) –A PyTorch dataloader of support data.
- **query_data_loader** (`DataLoader`) –A PyTorch dataloader of query data.
- **test_set_data_loader** (`DataLoader`) –A PyTorch dataloader of all test data. Default: *None*.

- **meta_test_cfg** (*dict*) –Config for meta testing. Default: None.
- **eval_kwargs** (*dict*) –Any keyword argument to be used for evaluation. Default: None.
- **logger** (*logging.Logger | None*) –Logger used for printing related information during evaluation. Default: None.
- **confidence_interval** (*float*) –Confidence interval. Default: 0.95.
- **show_task_results** (*bool*) –Whether to record the eval result of each task. Default: False.

返回

Dict of meta evaluate results, containing *accuracy_mean* and *accuracy_std* of all test tasks.

返回类型 dict | None

```
mmfewshot.classification.apis.process_support_images (model:
                                                    torch.nn.modules.module.Module,
                                                    support_imgs: List[str], support_labels:
                                                    List[str]) → None
```

Process support images.

参数

- **model** (*nn.Module*) –Classifier model.
- **support_imgs** (*list[str]*) –The image filenames.
- **support_labels** (*list[str]*) –The class names of support images.

```
mmfewshot.classification.apis.show_result_pyplot (img: str, result: Dict, fig_size: Tuple[int] =
                                                    (15, 10), wait_time: int = 0, out_file:
                                                    Optional[str] = None) → numpy.ndarray
```

Visualize the classification results on the image.

参数

- **img** (*str*) –Image filename.
- **result** (*dict*) –The classification result.
- **fig_size** (*tuple*) –Figure size of the pyplot figure. Default: (15, 10).
- **wait_time** (*int*) –How many seconds to display the image. Default: 0.
- **out_file** (*str | None*) –Default: None

返回 pyplot figure.

返回类型 np.ndarray

```
mmfewshot.classification.apis.single_gpu_meta_test (model:
    Union[mmcv.parallel.data_parallel.MMDDataParallel,
    torch.nn.modules.module.Module],
    num_test_tasks: int, support_dataloader:
    torch.utils.data.dataloader.DataLoader,

    tional[torch.utils.data.dataloader.DataLoader]
    = None, meta_test_cfg: Optional[Dict] =
    None, eval_kwargs: Optional[Dict] =
    None, logger: Optional[object] = None,
    confidence_interval: float = 0.95,
    show_task_results: bool = False) → Dict
```

Meta testing on single gpu.

During meta testing, model might be further fine-tuned or added extra parameters. While the tested model need to be restored after meta testing since meta testing can be used as the validation in the middle of training. To detach model from previous phase, the model will be copied and wrapped with `MetaTestParallel`. And it has full independence from the training model and will be discarded after the meta testing.

参数

- **model** (`MMDDataParallel | nn.Module`) –Model to be meta tested.
- **num_test_tasks** (`int`) –Number of meta testing tasks.
- **support_dataloader** (`DataLoader`) –A PyTorch dataloader of support data and it is used to fetch support data for each task.
- **query_dataloader** (`DataLoader`) –A PyTorch dataloader of query data and it is used to fetch query data for each task.
- **test_set_dataloader** (`DataLoader`) –A PyTorch dataloader of all test data and it is used for feature extraction from whole dataset to accelerate the testing. Default: None.
- **meta_test_cfg** (`dict`) –Config for meta testing. Default: None.
- **eval_kwargs** (`dict`) –Any keyword argument to be used for evaluation. Default: None.
- **logger** (`logging.Logger | None`) –Logger used for printing related information during evaluation. Default: None.
- **confidence_interval** (`float`) –Confidence interval. Default: 0.95.
- **show_task_results** (`bool`) –Whether to record the eval result of each task. Default: False.

返回

Dict of meta evaluate results, containing *accuracy_mean* and *accuracy_std* of all test tasks.

返回类型 dict

`mmfewshot.classification.apis.test_single_task` (*model*: `mmfewshot.classification.utils.meta_test_parallel.MetaTestParallel`, *support_dataloader*: `torch.utils.data.dataloader.DataLoader`, *query_dataloader*: `torch.utils.data.dataloader.DataLoader`, *meta_test_cfg*: `Dict`)

Test a single task.

A task has two stages: handling the support set and predicting the query set. In stage one, it currently supports fine-tune based and metric based methods. In stage two, it simply forward the query set and gather all the results.

参数

- **model** (`MetaTestParallel`) –Model to be meta tested.
- **support_dataloader** (`DataLoader`) –A PyTorch dataloader of support data.
- **query_dataloader** (`DataLoader`) –A PyTorch dataloader of query data.
- **meta_test_cfg** (`dict`) –Config for meta testing.

返回

- **results_list** (`list[np.ndarray]`): Predict results.
- **gt_labels** (`np.ndarray`): Ground truth labels.

返回类型 tuple

22.2 classification.core

22.2.1 evaluation

```
class mmfewshot.classification.core.evaluation.DistMetaTestEvalHook(support_dataloader:
                                                                    torch.utils.data.dataloader.DataLo
                                                                    query_dataloader:
                                                                    torch.utils.data.dataloader.DataLo
                                                                    test_set_dataloader:
                                                                    torch.utils.data.dataloader.DataLo
                                                                    num_test_tasks:
                                                                    int, interval: int
                                                                    = 1, by_epoch:
                                                                    bool = True,
                                                                    meta_test_cfg:
                                                                    Optional[Dict]
                                                                    = None, confi-
                                                                    dence_interval:
                                                                    float = 0.95,
                                                                    save_best: bool
                                                                    = True,
                                                                    key_indicator:
                                                                    str = 'accu-
                                                                    racy_mean',
                                                                    **eval_kwargs)
```

Distributed evaluation hook.

```

class mmfewshot.classification.core.evaluation.MetaTestEvalHook (support_data_loader:
                                                                    torch.utils.data.dataloader.DataLoader,
                                                                    query_data_loader:
                                                                    torch.utils.data.dataloader.DataLoader,
                                                                    test_set_data_loader:
                                                                    torch.utils.data.dataloader.DataLoader,
                                                                    num_test_tasks: int,
                                                                    interval: int = 1,
                                                                    by_epoch: bool =
                                                                    True, meta_test_cfg:
                                                                    Optional[Dict] =
                                                                    None,
                                                                    confidence_interval:
                                                                    float = 0.95,
                                                                    save_best: bool =
                                                                    True, key_indicator:
                                                                    str =
                                                                    'accuracy_mean',
                                                                    **eval_kwargs)

```

Evaluation hook for Meta Testing.

参数

- **support_data_loader** (`DataLoader`) –A PyTorch dataloader of support data.
- **query_data_loader** (`DataLoader`) –A PyTorch dataloader of query data.
- **test_set_data_loader** (`DataLoader`) –A PyTorch dataloader of all test data.
- **num_test_tasks** (`int`) –Number of tasks for meta testing.
- **interval** (`int`) –Evaluation interval (by epochs or iteration). Default: 1.
- **by_epoch** (`bool`) –Epoch based runner or not. Default: True.
- **meta_test_cfg** (`dict`) –Config for meta testing.
- **confidence_interval** (`float`) –Confidence interval. Default: 0.95.
- **save_best** (`bool`) –Whether to save best validated model. Default: True.
- **key_indicator** (`str`) –The validation metric for selecting the best model. Default: 'accuracy_mean' .
- **eval_kwargs** –Any keyword argument to be used for evaluation.

22.3 classification.datasets

class mmfewshot.classification.datasets.**BaseFewShotDataset** (*data_prefix: str, pipeline: List[Dict], classes: Optional[Union[str, List[str]]] = None, ann_file: Optional[str] = None*)

Base few shot dataset.

参数

- **data_prefix** (*str*) –The prefix of data path.
- **pipeline** (*list*) –A list of dict, where each element represents a operation defined in *mmcls.datasets.pipelines*.
- **classes** (*str | Sequence[str] | None*) –Classes for model training and provide fixed label for each class. Default: None.
- **ann_file** (*str | None*) –The annotation file. When *ann_file* is str, the subclass is expected to read from the *ann_file*. When *ann_file* is None, the subclass is expected to read according to *data_prefix*. Default: None.

property class_to_idx: Mapping

Map mapping class name to class index.

返回 mapping from class name to class index.

返回类型 dict

static evaluate (*results: List, gt_labels: numpy.array, metric: Union[str, List[str]] = 'accuracy', metric_options: Optional[dict] = None, logger: Optional[object] = None*) → Dict

Evaluate the dataset.

参数

- **results** (*list*) –Testing results of the dataset.
- **gt_labels** (*np.ndarray*) –Ground truth labels.
- **metric** (*str | list[str]*) –Metrics to be evaluated. Default value is *accuracy*.
- **metric_options** (*dict | None*) –Options for calculating metrics. Allowed keys are 'topk', 'thrs' and 'average_mode'. Default: None.
- **logger** (*logging.Logger | None*) –Logger used for printing related information during evaluation. Default: None.

返回 evaluation results

返回类型 dict

classmethod `get_classes` (*classes: Optional[Union[Sequence[str], str]] = None*) → Sequence[str]

Get class names of current dataset.

参数 `classes` (*Sequence[str] | str | None*) –Three types of input will correspond to different processing logics:

- If *classes* is a tuple or list, it will override the CLASSES predefined in the dataset.
- If *classes* is None, we directly use pre-defined CLASSES will be used by the dataset.
- If *classes* is a string, it is the path of a classes file that contains the name of all classes. Each line of the file contains a single class name.

返回 Names of categories of the dataset.

返回类型 tuple[str] or list[str]

sample_shots_by_class_id (*class_id: int, num_shots: int*) → List[int]

Random sample shots of given class id.

class `mmfewshot.classification.datasets.CUBDataset` (*classes_id_seed: Optional[int] = None, subset: typing_extensions.Literal[`train`, `test`, `val`] = `'train'`, *args, **kwargs*)

CUB dataset for few shot classification.

参数

- **classes_id_seed** (*int | None*) –A random seed to shuffle order of classes. If seed is None, the classes will be arranged in alphabetical order. Default: None.
- **subset** (*str | list[str]*) –The classes of whole dataset are split into three disjoint subset: train, val and test. If subset is a string, only one subset data will be loaded. If subset is a list of string, then all data of subset in list will be loaded. Options: [`'train'` , `'val'` , `'test'`]. Default: `'train'` .

get_classes (*classes: Optional[Union[Sequence[str], str]] = None*) → Sequence[str]

Get class names of current dataset.

参数 `classes` (*Sequence[str] | str | None*) –Three types of input will correspond to different processing logics:

- If *classes* is a tuple or list, it will override the CLASSES predefined in the dataset.
- If *classes* is None, we directly use pre-defined CLASSES will be used by the dataset.
- If *classes* is a string, it is the path of a classes file that contains the name of all classes. Each line of the file contains a single class name.

返回 Names of categories of the dataset.

返回类型 tuple[str] or list[str]

load_annotatations () → List[Dict]

Load annotation according to the classes subset.

```
class mmfewshot.classification.datasets.EpisodicDataset (dataset: Dataset, num_episodes: int, num_ways: int, num_shots: int, num_queries: int, episodes_seed: int | None = None)
```

A wrapper of episodic dataset.

It will generate a list of support and query images indices for each episode (support + query images). Every call of `__getitem__` will fetch and return ($num_ways * num_shots$) support images and ($num_ways * num_queries$) query images according to the generated images indices. Note that all the episode indices are generated at once using a specific random seed to ensure the reproducibility for same dataset.

参数

- **dataset** (*Dataset*) –The dataset to be wrapped.
- **num_episodes** (*int*) –Number of episodes. Noted that all episodes are generated at once and will not be changed afterwards. Make sure setting the *num_episodes* larger than your needs.
- **num_ways** (*int*) –Number of ways for each episode.
- **num_shots** (*int*) –Number of support data of each way for each episode.
- **num_queries** (*int*) –Number of query data of each way for each episode.
- **episodes_seed** (*int | None*) –A random seed to reproduce episodic indices. If seed is None, it will use runtime random seed. Default: None.

evaluate (**args, **kwargs*) → list

Evaluate prediction.

generate_episodic_idxes () → tuple[list[Mapping], list[list[int]]]

Generate batch indices for each episodic.

get_episode_class_ids (*idx: int*) → list[int]

Return class ids in one episode.

```
class mmfewshot.classification.datasets.LoadImageFromBytes (to_float32=False, color_type='color', file_client_args={'backend': 'disk'})
```

Load an image from bytes.

```
class mmfewshot.classification.datasets.MetaTestDataset (*args, **kwargs)
```

A wrapper of the episodic dataset for meta testing.

During meta test, the *MetaTestDataset* will be copied and converted into three mode: *test_set*, *support*, and *test*. Each mode of dataset will be used in different dataloader, but they share the same episode and image information.

- In *test_set* mode, the dataset will fetch all images from the whole test set to extract features from the fixed backbone, which can accelerate meta testing.
- In *support* or *query* mode, the dataset will fetch images according to the *episode_idxes* with the same *task_id*. Therefore, the support and query dataset must be set to the same *task_id* in each test task.

cache_feats (*feats: torch.Tensor, img metas: dict*) → None

Cache extracted feats into dataset.

set_task_id (*task_id: int*) → None

Query and support dataset use same task id to make sure fetch data from same episode.

```
class mmfewshot.classification.datasets.MiniImageNetDataset (subset: typing_extensions.Literal[train, test, val] = 'train',  
file_format: str = 'JPEG',  
*args, **kwargs)
```

MiniImageNet dataset for few shot classification.

参数

- **subset** (*str | list[str]*) –The classes of whole dataset are split into three disjoint subset: train, val and test. If subset is a string, only one subset data will be loaded. If subset is a list of string, then all data of subset in list will be loaded. Options: [‘train’ , ‘val’ , ‘test’]. Default: ‘train’ .
- **file_format** (*str*) –The file format of the image. Default: ‘JPEG’

get_classes (*classes: Optional[Union[Sequence[str], str]] = None*) → Sequence[str]

Get class names of current dataset.

参数 classes (*Sequence[str] | str | None*) –Three types of input will correspond to different processing logics:

- If *classes* is a tuple or list, it will override the CLASSES predefined in the dataset.
- If *classes* is None, we directly use pre-defined CLASSES will be used by the dataset.
- If *classes* is a string, it is the path of a classes file that contains the name of all classes. Each line of the file contains a single class name.

返回 Names of categories of the dataset.

返回类型 tuple[str] or list[str]

load_annotations () → List

Load annotation according to the classes subset.

class mmfewshot.classification.datasets.**TieredImageNetDataset** (*subset: typing_extensions.Literal[`train`, `test`, `val`]* = `'train'`, *args, **kwargs)

TieredImageNet dataset for few shot classification.

参数 subset (*str | list[str]*) – The classes of whole dataset are split into three disjoint subset: train, val and test. If subset is a string, only one subset data will be loaded. If subset is a list of string, then all data of subset in list will be loaded. Options: [`'train'` , `'val'` , `'test'`]. Default: `'train'` .

get_classes (*classes: Optional[Union[Sequence[str], str]] = None*) → Sequence[str]

Get class names of current dataset.

参数 classes (*Sequence[str] | str | None*) – Three types of input will correspond to different processing logics:

- If *classes* is a tuple or list, it will override the CLASSES predefined in the dataset.
- If *classes* is None, we directly use pre-defined CLASSES will be used by the dataset.
- If *classes* is a string, it is the path of a classes file that contains the name of all classes. Each line of the file contains a single class name.

返回 Names of categories of the dataset.

返回类型 tuple[str] or list[str]

get_general_classes () → List[str]

Get general classes of each classes.

load_annotations () → List[Dict]

Load annotation according to the classes subset.

mmfewshot.classification.datasets.**build_dataloader** (*dataset: torch.utils.data.dataset.Dataset, samples_per_gpu: int, workers_per_gpu: int, num_gpus: int = 1, dist: bool = True, shuffle: bool = True, round_up: bool = True, seed: Optional[int] = None, pin_memory: bool = False, use_infinite_sampler: bool = False, **kwargs*) → torch.utils.data.dataloader.DataLoader

Build PyTorch DataLoader.

In distributed training, each GPU/process has a dataloader. In non-distributed training, there is only one dataloader for all GPUs.

参数

- **dataset** (*Dataset*) –A PyTorch dataset.
- **samples_per_gpu** (*int*) –Number of training samples on each GPU, i.e., batch size of each GPU.
- **workers_per_gpu** (*int*) –How many subprocesses to use for data loading for each GPU.
- **num_gpus** (*int*) –Number of GPUs. Only used in non-distributed training.
- **dist** (*bool*) –Distributed training/test or not. Default: True.
- **shuffle** (*bool*) –Whether to shuffle the data at every epoch. Default: True.
- **round_up** (*bool*) –Whether to round up the length of dataset by adding extra samples to make it evenly divisible. Default: True.
- **seed** (*int | None*) –Random seed. Default:None.
- **pin_memory** (*bool*) –Whether to use pin_memory for dataloader. Default: False.
- **use_infinite_sampler** (*bool*) –Whether to use infinite sampler. Noted that infinite sampler will keep iterator of dataloader running forever, which can avoid the overhead of worker initialization between epochs. Default: False.
- **kwargs** –any keyword argument to be used to initialize DataLoader

返回 A PyTorch dataloader.

返回类型 DataLoader

```
mmfewshot.classification.datasets.build_meta_test_dataloader (dataset:
                                                                    torch.utils.data.dataset.Dataset,
                                                                    meta_test_cfg: Dict,
                                                                    **kwargs) →
                                                                    torch.utils.data.dataloader.DataLoader
```

Build PyTorch DataLoader.

In distributed training, each GPU/process has a dataloader. In non-distributed training, there is only one dataloader for all GPUs.

参数

- **dataset** (*Dataset*) –A PyTorch dataset.
- **meta_test_cfg** (*dict*) –Config of meta testing.
- **kwargs** –any keyword argument to be used to initialize DataLoader

返回

support_data_loader, *query_data_loader* and *test_set_data_loader*.

返回类型 tuple[Dataloader]

`mmfewshot.classification.datasets.label_wrapper` (*labels*: Union[torch.Tensor, numpy.ndarray, List], *class_ids*: List[int]) → Union[torch.Tensor, numpy.ndarray, list]

Map input labels into range of 0 to numbers of classes-1.

It is usually used in the meta testing phase, in which the class ids are random sampled and discontinuous.

参数

- **labels** (*Tensor* | *np.ndarray* | *list*) –The labels to be wrapped.
- **class_ids** (*list[int]*) –All class ids of labels.

返回 Same type as the input labels.

返回类型 (Tensor | np.ndarray | list)

22.4 classification.models

22.4.1 backbones

class `mmfewshot.classification.models.backbones.Conv4` (*depth*: int = 4, *pooling_blocks*: Sequence[int] = (0, 1, 2, 3), *padding_blocks*: Sequence[int] = (0, 1, 2, 3), *flatten*: bool = True)

class `mmfewshot.classification.models.backbones.ConvNet` (*depth*: int, *pooling_blocks*: Sequence[int], *padding_blocks*: Sequence[int], *flatten*: bool = True)

Simple ConvNet.

参数

- **depth** (*int*) –The number of *ConvBlock*.
- **pooling_blocks** (*Sequence[int]*) –Indicate which block to use 2x2 max pooling.
- **padding_blocks** (*Sequence[int]*) –Indicate which block to use conv layer with padding.
- **flatten** (*bool*) –Whether to flatten features from (N, C, H, W) to (N, C*H*W). Default: True.

forward (*x*: torch.Tensor) → torch.Tensor

Defines the computation performed at every call.

Should be overridden by all subclasses.

注解: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

```
class mmfewshot.classification.models.backbones.ResNet12 (block:
    torch.nn.modules.module.Module
    = <class 'mmfew-
    shot.classification.models.backbones.resnet12.Basic
    with_avgpool: bool = True,
    pool_size: Tuple[int, int] = (1,
    1), flatten: bool = True,
    drop_rate: float = 0.0,
    drop_block_size: int = 5)
```

ResNet12.

参数

- **block** (*nn.Module*) –Block to build layers. Default: `BasicBlock`.
- **with_avgpool** (*bool*) –Whether to average pool the features. Default: `True`.
- **pool_size** (*tuple(int, int)*) –The output shape of average pooling layer. Default: `(1, 1)`.
- **flatten** (*bool*) –Whether to flatten features from `(N, C, H, W)` to `(N, C*H*W)`. Default: `True`.
- **drop_rate** (*float*) –Dropout rate. Default: `0.0`.
- **drop_block_size** (*int*) –Size of drop block. Default: `5`.

forward (*x: torch.Tensor*) → `torch.Tensor`

Defines the computation performed at every call.

Should be overridden by all subclasses.

注解: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

```
class mmfewshot.classification.models.backbones.WRN28x10 (depth: int = 28, widen_factor:  
int = 10, stride: int = 1,  
drop_rate: float = 0.5, flatten:  
bool = True, with_avgpool: bool  
= True, pool_size: Tuple[int, int]  
= (1, 1))
```

```
class mmfewshot.classification.models.backbones.WideResNet (depth: int, widen_factor: int  
= 1, stride: int = 1,  
drop_rate: float = 0.0,  
flatten: bool = True,  
with_avgpool: bool = True,  
pool_size: Tuple[int, int] =  
(1, 1))
```

WideResNet.

参数

- **depth** (*int*) –The number of layers.
- **widen_factor** (*int*) –The widen factor of channels. Default: 1.
- **stride** (*int*) –Stride of first layer. Default: 1.
- **drop_rate** (*float*) –Dropout rate. Default: 0.0.
- **with_avgpool** (*bool*) –Whether to average pool the features. Default: True.
- **flatten** (*bool*) –Whether to flatten features from (N, C, H, W) to (N, C*H*W). Default: True.
- **pool_size** (*tuple(int, int)*) –The output shape of average pooling layer. Default: (1, 1).

forward (*x: torch.Tensor*) → torch.Tensor

Defines the computation performed at every call.

Should be overridden by all subclasses.

注解: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

22.4.2 classifier

22.4.3 heads

```
class mmfewshot.classification.models.heads.CosineDistanceHead(num_classes: int,
                                                             in_channels: int,
                                                             temperature:
                                                             Optional[float] =
                                                             None, eps: float =
                                                             1e-05, *args,
                                                             **kwargs)
```

Classification head for **'Baseline++ <https://arxiv.org/abs/2003.04390>'**.

参数

- **num_classes** (*int*) –Number of categories.
- **in_channels** (*int*) –Number of channels in the input feature map.
- **temperature** (*float | None*) –Scaling factor of *cls_score*. Default: None.
- **eps** (*float*) –Constant variable to avoid division by zero. Default: 0.00001.

before_forward_query () → None

Used in meta testing.

This function will be called before model forward query data during meta testing.

before_forward_support () → None

Used in meta testing.

This function will be called before model forward support data during meta testing.

forward_query (*x: torch.Tensor, **kwargs*) → List

Forward query data in meta testing.

forward_support (*x: torch.Tensor, gt_label: torch.Tensor, **kwargs*) → Dict

Forward support data in meta testing.

forward_train (*x: torch.Tensor, gt_label: torch.Tensor, **kwargs*) → Dict

Forward training data.

```
class mmfewshot.classification.models.heads.LinearHead(num_classes: int, in_channels: int,
                                                         *args, **kwargs)
```

Classification head for Baseline.

参数

- **num_classes** (*int*) –Number of categories.
- **in_channels** (*int*) –Number of channels in the input feature map.

before_forward_query () → None

Used in meta testing.

This function will be called before model forward query data during meta testing.

before_forward_support () → None

Used in meta testing.

This function will be called before model forward support data during meta testing.

forward_query (*x: torch.Tensor, **kwargs*) → List

Forward query data in meta testing.

forward_support (*x: torch.Tensor, gt_label: torch.Tensor, **kwargs*) → Dict

Forward support data in meta testing.

forward_train (*x: torch.Tensor, gt_label: torch.Tensor, **kwargs*) → Dict

Forward training data.

```
class mmfewshot.classification.models.heads.MatchingHead (temperature: float = 100, loss:
                                                    Dict = {'loss_weight': 1.0, 'type':
                                                    'NLLLoss'}, *args, **kwargs)
```

Classification head for `MatchingNet`.

<https://arxiv.org/abs/1606.04080>.

Note that this implementation is without FCE(Full Context Embeddings).

参数

- **temperature** (*float*) –The scale factor of *cls_score*.
- **loss** (*dict*) –Config of training loss.

before_forward_query () → None

Used in meta testing.

This function will be called before model forward query data during meta testing.

before_forward_support () → None

Used in meta testing.

This function will be called before model forward support data during meta testing.

forward_query (*x: torch.Tensor, **kwargs*) → List

Forward query data in meta testing.

forward_support (*x: torch.Tensor, gt_label: torch.Tensor, **kwargs*) → None

Forward support data in meta testing.

forward_train (*support_feats: torch.Tensor, support_labels: torch.Tensor, query_feats: torch.Tensor,*
*query_labels: torch.Tensor, **kwargs*) → Dict

Forward training data.

参数

- **support_feats** (*Tensor*) –Features of support data with shape (N, C).
- **support_labels** (*Tensor*) –Labels of support data with shape (N).
- **query_feats** (*Tensor*) –Features of query data with shape (N, C).
- **query_labels** (*Tensor*) –Labels of query data with shape (N).

返回 A dictionary of loss components.

返回类型 dict[str, Tensor]

```
class mmfewshot.classification.models.heads.MetaBaselineHead (temperature: float = 10.0,  
learnable_temperature:  
bool = True, *args,  
**kwargs)
```

Classification head for ‘[MetaBaseline https://arxiv.org/abs/2003.04390](https://arxiv.org/abs/2003.04390)’.

参数

- **temperature** (*float*) –Scaling factor of *cls_score*. Default: 10.0.
- **learnable_temperature** (*bool*) –Whether to use learnable scale factor or not. Default: True.

before_forward_query () → None

Used in meta testing.

This function will be called before model forward query data during meta testing.

before_forward_support () → None

Used in meta testing.

This function will be called before model forward support data during meta testing.

forward_query (*x: torch.Tensor, **kwargs*) → List

Forward query data in meta testing.

forward_support (*x: torch.Tensor, gt_label: torch.Tensor, **kwargs*) → None

Forward support data in meta testing.

forward_train (*support_feats: torch.Tensor, support_labels: torch.Tensor, query_feats: torch.Tensor,*
*query_labels: torch.Tensor, **kwargs*) → Dict

Forward training data.

参数

- **support_feats** (*Tensor*) –Features of support data with shape (N, C).
- **support_labels** (*Tensor*) –Labels of support data with shape (N).
- **query_feats** (*Tensor*) –Features of query data with shape (N, C).

- **query_labels** (*Tensor*) –Labels of query data with shape (N).

返回 A dictionary of loss components.

返回类型 dict[str, Tensor]

```
class mmfewshot.classification.models.heads.NegMarginHead (num_classes: int, in_channels: int, temperature: float = 30.0, margin: float = 0.0, metric_type: str = 'cosine', *args, **kwargs)
```

Classification head for `NegMargin`.

参数

- **num_classes** (*int*) –Number of categories.
- **in_channels** (*int*) –Number of channels in the input feature map.
- **temperature** (*float*) –Scaling factor of *cls_score*. Default: 30.0.
- **margin** (*float*) –Margin of *cls_score*. Default: 0.0.
- **metric_type** (*str*) –The way to calculate similarity. Options: ['cosine' , 'softmax']. Default: 'cosine'

before_forward_query () → None

Used in meta testing.

This function will be called before model forward query data during meta testing.

before_forward_support () → None

Used in meta testing.

This function will be called before model forward support data during meta testing.

forward_query (*x: torch.Tensor, **kwargs*) → List

Forward query data in meta testing.

forward_support (*x: torch.Tensor, gt_label: torch.Tensor, **kwargs*) → Dict

Forward support data in meta testing.

forward_train (*x: torch.Tensor, gt_label: torch.Tensor, **kwargs*) → Dict

Forward training data.

```
class mmfewshot.classification.models.heads.PrototypeHead (*args, **kwargs)
```

Classification head for 'ProtoNet.

<<https://arxiv.org/abs/1703.05175>>'_.

before_forward_query () → None

Used in meta testing.

This function will be called before model forward query data during meta testing.

before_forward_support () → None

Used in meta testing.

This function will be called before model forward support data during meta testing.

forward_query (*x: torch.Tensor, **kwargs*) → List

Forward query data in meta testing.

forward_support (*x: torch.Tensor, gt_label: torch.Tensor, **kwargs*) → None

Forward support data in meta testing.

forward_train (*support_feats: torch.Tensor, support_labels: torch.Tensor, query_feats: torch.Tensor, query_labels: torch.Tensor, **kwargs*) → Dict

Forward training data.

参数

- **support_feats** (*Tensor*) –Features of support data with shape (N, C).
- **support_labels** (*Tensor*) –Labels of support data with shape (N).
- **query_feats** (*Tensor*) –Features of query data with shape (N, C).
- **query_labels** (*Tensor*) –Labels of query data with shape (N).

返回 A dictionary of loss components.

返回类型 dict[str, Tensor]

```
class mmfewshot.classification.models.heads.RelationHead (in_channels: int, feature_size: Tuple[int] = (7, 7), hidden_channels: int = 8, loss: Dict = {'loss_weight': 1.0, 'type': 'CrossEntropyLoss'}, *args, **kwargs)
```

Classification head for `RelationNet`.

<<https://arxiv.org/abs/1711.06025>>‘_.

参数

- **in_channels** (*int*) –Number of channels in the input feature map.
- **feature_size** (*tuple(int, int)*) –Size of the input feature map. Default: (7, 7).
- **hidden_channels** (*int*) –Number of channels for the hidden fc layer. Default: 8.
- **loss** (*dict*) –Training loss. Options are CrossEntropyLoss and MSELoss.

before_forward_query () → None

Used in meta testing.

This function will be called before model forward query data during meta testing.

before_forward_support () → None

Used in meta testing.

This function will be called before model forward support data during meta testing.

forward_query (*x: torch.Tensor, **kwargs*) → List

Forward query data in meta testing.

forward_relation_module (*x: torch.Tensor*) → torch.Tensor

Forward function for relation module.

forward_support (*x: torch.Tensor, gt_label: torch.Tensor, **kwargs*) → None

Forward support data in meta testing.

forward_train (*support_feats: torch.Tensor, support_labels: torch.Tensor, query_feats: torch.Tensor, query_labels: torch.Tensor, **kwargs*) → Dict

Forward training data.

参数

- **support_feats** (*Tensor*) –Features of support data with shape (N, C, H, W).
- **support_labels** (*Tensor*) –Labels of support data with shape (N).
- **query_feats** (*Tensor*) –Features of query data with shape (N, C, H, W).
- **query_labels** (*Tensor*) –Labels of query data with shape (N).

返回 A dictionary of loss components.

返回类型 dict[str, Tensor]

init_weights () → None

Initialize the weights.

22.4.4 losses

```
class mmfewshot.classification.models.losses.MSELoss (reduction:
                                                    typing_extensions.Literal[none, mean,
                                                    sum] = 'mean', loss_weight: float =
                                                    1.0)
```

MSELoss.

参数

- **reduction** (*str*) –The method that reduces the loss to a scalar. Options are “none” , “mean” and “sum” . Default: ‘mean’ .
- **loss_weight** (*float*) –The weight of the loss. Default: 1.0.

forward (*pred: torch.Tensor, target: torch.Tensor, weight: Optional[torch.Tensor] = None, avg_factor: Optional[Union[float, int]] = None, reduction_override: Optional[str] = None*) → torch.Tensor
 Forward function of loss.

参数

- **pred** (*Tensor*) –The prediction with shape (N, *), where * means any number of additional dimensions.
- **target** (*Tensor*) –The learning target of the prediction with shape (N, *) same as the input.
- **weight** (*Tensor | None*) –Weight of the loss for each prediction. Default: None.
- **avg_factor** (*float | int | None*) –Average factor that is used to average the loss. Default: None.
- **reduction_override** (*str | None*) –The reduction method used to override the original reduction method of the loss. Options are “none”, “mean” and “sum”. Default: None.

返回 The calculated loss

返回类型 Tensor

```
class mmfewshot.classification.models.losses.NLLLoss (reduction: typing_extensions.Literal[none, mean, sum] = 'mean', loss_weight: float = 1.0)
```

NLLLoss.

参数

- **reduction** (*str*) –The method that reduces the loss to a scalar. Options are “none”, “mean” and “sum”. Default: ‘mean’.
- **loss_weight** (*float*) –The weight of the loss. Default: 1.0.

forward (*pred: torch.Tensor, target: torch.Tensor, weight: Optional[torch.Tensor] = None, avg_factor: Optional[Union[float, int]] = None, reduction_override: Optional[str] = None*) → torch.Tensor
 Forward function of loss.

参数

- **pred** (*Tensor*) –The prediction with shape (N, C).
- **target** (*Tensor*) –The learning target of the prediction. with shape (N, 1).
- **weight** (*Tensor | None*) –Weight of the loss for each prediction. Default: None.
- **avg_factor** (*float | int | None*) –Average factor that is used to average the loss. Default: None.

- **reduction_override** (*str* / *None*) –The reduction method used to override the original reduction method of the loss. Options are “none”, “mean” and “sum”. Default: None.

返回 The calculated loss

返回类型 Tensor

22.4.5 utils

```
mmfewshot.classification.models.utils.convert_maml_module (module:
                                                                torch.nn.modules.module.Module)
                                                                →
                                                                torch.nn.modules.module.Module
```

Convert a normal model to MAML model.

Replace nn.Linear with LinearWithFastWeight, nn.Conv2d with Conv2dWithFastWeight and BatchNorm2d with BatchNorm2dWithFastWeight.

参数 **module** (*nn.Module*) –The module to be converted.

Returns : nn.Module: A MAML module.

22.5 classification.utils

```
class mmfewshot.classification.utils.MetaTestParallel (module:
                                                       torch.nn.modules.module.Module,
                                                       dim: int = 0)
```

The MetaTestParallel module that supports DataContainer.

Note that each task is tested on a single GPU. Thus the data and model on different GPU should be independent. MMDistributedDataParallel always automatically synchronizes the grad in different GPUs when doing the loss backward, which can not meet the requirements. Thus we simply copy the module and wrap it with an *MetaTestParallel*, which will send data to the device model.

MetaTestParallel has two main differences with PyTorch DataParallel:

- It supports a custom type *DataContainer* which allows more flexible control of input data during both GPU and CPU inference.
- It implement three more APIs *before_meta_test()*, *before_forward_support()* and *before_forward_query()*.

参数

- **module** (*nn.Module*) –Module to be encapsulated.

- **dim** (*int*) –Dimension used to scatter the data. Defaults to 0.

forward (**inputs, **kwargs*)

Override the original forward function.

The main difference lies in the CPU inference where the data in `DataContainers` will still be gathered.

23.1 detection.apis

`mmfewshot.detection.apis.inference_detector` (*model*: `torch.nn.modules.module.Module`, *imgs*: `Union[List[str], str]`) → List

Inference images with the detector.

参数

- **model** (`nn.Module`) –Detector.
- **imgs** (`list[str] | str`) –Batch or single image file.

返回

If imgs is a list or tuple, the same length list type results will be returned, otherwise return the detection results directly.

返回类型 list

`mmfewshot.detection.apis.init_detector` (*config*: `Union[str, mmcv.utils.config.Config]`, *checkpoint*: `Optional[str] = None`, *device*: `str = 'cuda:0'`, *cfg_options*: `Optional[Dict] = None`, *classes*: `Optional[List[str]] = None`) → `torch.nn.modules.module.Module`

Prepare a detector from config file.

参数

- **config** (`str | mmcv.Config`) –Config file path or the config object.

- **checkpoint** (*str* | *None*) –Checkpoint path. If left as *None*, the model will not load any weights.
- **device** (*str*) –Runtime device. Default: ‘cuda:0’ .
- **cfg_options** (*dict* | *None*) –Options to override some settings in the used config.
- **classes** (*list[str]* | *None*) –Options to override classes name of model. Default: *None*.

返回 The constructed detector.

返回类型 nn.Module

`mmfewshot.detection.apis.multi_gpu_model_init` (*model: torch.nn.modules.module.Module, data_loader: torch.utils.data.dataloader.DataLoader*) → List

Forward support images for meta-learning based detector initialization.

The function usually will be called before `single_gpu_test` in `QuerySupportEvalHook`. It firstly forwards support images with `mode=model_init` and the features will be saved in the model. Then it will call `:func:model_init` to process the extracted features of support images to finish the model initialization.

Noted that the `data_loader` should NOT use distributed sampler, all the models in different gpus should be initialized with same images.

参数

- **model** (*nn.Module*) –Model used for extracting support template features.
- **data_loader** (*nn.DataLoader*) –Pytorch data loader.

返回 Extracted support template features.

返回类型 list[*Tensor*]

`mmfewshot.detection.apis.multi_gpu_test` (*model: torch.nn.modules.module.Module, data_loader: torch.utils.data.dataloader.DataLoader, tmpdir: Optional[str] = None, gpu_collect: bool = False*) → List

Test model with multiple gpus for meta-learning based detector.

The model forward function requires `mode`, while in `mmdet` it requires `return_loss`. And the `encode_mask_results` is removed. This method tests model with multiple gpus and collects the results under two different modes: `gpu` and `cpu` modes. By setting ‘`gpu_collect=True`’ it encodes results to `gpu` tensors and use `gpu` communication for results collection. On `cpu` mode it saves the results on different gpus to ‘`tmpdir`’ and collects them by the rank 0 worker.

参数

- **model** (*nn.Module*) –Model to be tested.
- **data_loader** (*DataLoader*) –Pytorch data loader.

- **tmpdir** (*str*) –Path of directory to save the temporary results from different gpus under cpu mode. Default: None.
- **gpu_collect** (*bool*) –Option to use either gpu or cpu to collect results. Default: False.

返回 The prediction results.

返回类型 list

`mmfewshot.detection.apis.process_support_images` (*model: torch.nn.modules.module.Module, support_imgs: List[str], support_labels: List[List[str]], support_bboxes: Optional[List[List[float]]] = None, classes: Optional[List[str]] = None*) → None

Process support images for query support detector.

参数

- **model** (*nn.Module*) –Detector.
- **support_imgs** (*list[str]*) –Support image filenames.
- **support_labels** (*list[list[str]*) –Support labels of each bbox.
- **support_bboxes** (*list[list[list[float]]] | None*) –Bbox in support images. If it set to None, it will use the [0, 0, image width, image height] as bbox. Default: None.
- **classes** (*list[str] | None*) –Options to override classes name of model. Default: None.

`mmfewshot.detection.apis.single_gpu_model_init` (*model: torch.nn.modules.module.Module, data_loader: torch.utils.data.data_loader.DataLoader*) → List

Forward support images for meta-learning based detector initialization.

The function usually will be called before `single_gpu_test` in `QuerySupportEvalHook`. It firstly forwards support images with `mode=model_init` and the features will be saved in the model. Then it will call `:func:model_init` to process the extracted features of support images to finish the model initialization.

参数

- **model** (*nn.Module*) –Model used for extracting support template features.
- **data_loader** (*nn.DataLoader*) –Pytorch data loader.

返回 Extracted support template features.

返回类型 list[Tensor]

`mmfewshot.detection.apis.single_gpu_test` (*model*: `torch.nn.modules.module.Module`, *data_loader*: `torch.utils.data.data_loader.DataLoader`, *show*: `bool = False`, *out_dir*: `Optional[str] = None`, *show_score_thr*: `float = 0.3`) → List

Test model with single gpu for meta-learning based detector.

The model forward function requires *mode*, while in mmdet it requires *return_loss*. And the *encode_mask_results* is removed.

参数

- **model** (`nn.Module`) –Model to be tested.
- **data_loader** (`DataLoader`) –Pytorch data loader.
- **show** (`bool`) –Whether to show the image. Default: False.
- **out_dir** (`str | None`) –The directory to write the image. Default: None.
- **show_score_thr** (`float`) –Minimum score of bboxes to be shown. Default: 0.3.

返回 The prediction results.

返回类型 list

23.2 detection.core

23.2.1 evaluation

class `mmfewshot.detection.core.evaluation.QuerySupportDistEvalHook` (*model_init_data_loader*: `torch.utils.data.data_loader.DataLoader`, *val_data_loader*: `torch.utils.data.data_loader.DataLoader`, ***eval_kwargs*)

Distributed evaluation hook for query support data pipeline.

This hook will first traverse *model_init_data_loader* to extract support features for model initialization and then evaluate the data from *val_data_loader*.

Noted that *model_init_data_loader* should NOT use distributed sampler to make all the models on different gpus get same data results in same initialized models.

参数

- **model_init_data_loader** (`DataLoader`) –A PyTorch dataloader of *model_init* dataset.
- **val_data_loader** (`DataLoader`) –A PyTorch dataloader of dataset to be evaluated.
- ****eval_kwargs** –Evaluation arguments fed into the evaluate function of the dataset.

```
class mmfewshot.detection.core.evaluation.QuerySupportEvalHook (model_init_data_loader:
    torch.utils.data.data_loader.DataLoader,
    val_data_loader:
    torch.utils.data.data_loader.DataLoader,
    **eval_kwargs)
```

Evaluation hook for query support data pipeline.

This hook will first traverse *model_init_data_loader* to extract support features for model initialization and then evaluate the data from *val_data_loader*.

参数

- **model_init_data_loader** (*DataLoader*) –A PyTorch dataloader of *model_init* dataset.
- **val_data_loader** (*DataLoader*) –A PyTorch dataloader of dataset to be evaluated.
- ****eval_kwargs** –Evaluation arguments fed into the evaluate function of the dataset.

```
mmfewshot.detection.core.evaluation.eval_map (det_results: List[List[numpy.ndarray]],
    annotations: List[Dict], classes: List[str],
    scale_ranges: Optional[List[Tuple]] = None,
    iou_thr: float = 0.5, dataset: Optional[Union[str,
    List[str]]] = None, logger: Optional[object] =
    None, tpfp_fn: Optional[callable] = None, nproc:
    int = 4, use_legacy_coordinate: bool = False) →
    Tuple[List, List[Dict]]
```

Evaluate mAP of a dataset.

eval_map() in *mmfcdet* predefines the names of classes and thus not supports report map results of arbitrary class splits.

参数

- **det_results** (*list[list[*np.ndarray*]] | list[tuple[*np.ndarray*]]*)
–The outer list indicates images, and the inner list indicates per-class detected bboxes.
- **annotations** (*list[dict]*) –Ground truth annotations where each item of the list indicates an image. Keys of annotations are:
 - *bboxes*: numpy array of shape (n, 4)
 - *labels*: numpy array of shape (n,)
 - *bboxes_ignore* (optional): numpy array of shape (k, 4)
 - *labels_ignore* (optional): numpy array of shape (k,)
- **classes** (*list[str]*) –Names of class.

- **scale_ranges** (*list[tuple] | None*) –Range of scales to be evaluated, in the format [(min1, max1), (min2, max2), ...]. A range of (32, 64) means the area range between (32**2, 64**2). Default: None.
- **iou_thr** (*float*) –IoU threshold to be considered as matched. Default: 0.5.
- **dataset** (*list[str] | str | None*) –Dataset name or dataset classes, there are minor differences in metrics for different datasets, e.g. “voc07”, “imagenet_det”, etc. Default: None.
- **logger** (*logging.Logger | None*) –The way to print the mAP summary. See `mmcv.utils.print_log()` for details. Default: None.
- **tpfp_fn** (*callable | None*) –The function used to determine true false positives. If None, `tpfp_default()` is used as default unless dataset is ‘det’ or ‘vid’ (`tpfp_imagenet()` in this case). If it is given as a function, then this function is used to evaluate tp & fp. Default None.
- **nproc** (*int*) –Processes used for computing TP and FP. Default: 4.
- **use_legacy_coordinate** (*bool*) –Whether to use coordinate system in mmdet v1.x. which means width, height should be calculated as ‘x2 - x1 + 1’ and ‘y2 - y1 + 1’ respectively. Default: False.

返回 (list, [dict, dict, ...])

返回类型 tuple

23.2.2 utils

```
class mmfewshot.detection.core.utils.ContrastiveLossDecayHook (decay_steps:
                                                    Sequence[int],
                                                    decay_rate: float = 0.5)
```

Hook for contrast loss weight decay used in FSCE.

参数

- **decay_steps** (*list[int] | tuple[int]*) –Each item in the list is the step to decay the loss weight.
- **decay_rate** (*float*) –Decay rate. Default: 0.5.

23.3 detection.datasets

```
class mmfewshot.detection.datasets.BaseFewShotDataset (ann_cfg: List[Dict], classes:
Optional[Union[str, Sequence[str]]],
pipeline: Optional[List[Dict]] =
None, multi_pipelines:
Optional[Dict[str, List[Dict]]] =
None, data_root: Optional[str] =
None, img_prefix: str = "", seg_prefix:
Optional[str] = None, proposal_file:
Optional[str] = None, test_mode:
bool = False, filter_empty_gt: bool =
True, min_bbox_size:
Optional[Union[float, int]] = None,
ann_shot_filter: Optional[Dict] =
None, instance_wise: bool = False,
dataset_name: Optional[str] =
None)
```

Base dataset for few shot detection.

The main differences with normal detection dataset fall in two aspects.

- **It allows to specify single (used in normal dataset) or multiple** (used in query-support dataset) pipelines for data processing.
- **It supports to control the maximum number of instances of each class** when loading the annotation file.

The annotation format is shown as follows. The *ann* field is optional for testing.

```
[
  {
    'id': '0000001'
    'filename': 'a.jpg',
    'width': 1280,
    'height': 720,
    'ann': {
      'bboxes': <np.ndarray> (n, 4) in (x1, y1, x2, y2) order.
      'labels': <np.ndarray> (n, ),
      'bboxes_ignore': <np.ndarray> (k, 4), (optional field)
      'labels_ignore': <np.ndarray> (k, 4) (optional field)
    }
  },
  ...
]
```

参数

- **ann_cfg** (*list[dict]*) –Annotation config support two type of config.
 - loading annotation from common ann_file of dataset with or without specific classes. example:dict(type=' ann_file' , ann_file=' path/to/ann_file' , ann_classes=['dog' , 'cat'])
 - loading annotation from a json file saved by dataset. example:dict(type=' saved_dataset' , ann_file=' path/to/ann_file')
- **classes** (*str | Sequence[str] | None*) –Classes for model training and provide fixed label for each class.
- **pipeline** (*list[dict] | None*) –Config to specify processing pipeline. Used in normal dataset. Default: None.
- **multi_pipelines** (*dict[list[dict]]*) –Config to specify data pipelines for corresponding data flow. For example, query and support data can be processed with two different pipelines, the dict should contain two keys like:
 - query (list[dict]): Config for query-data process pipeline.
 - support (list[dict]): Config for support-data process pipeline.
- **data_root** (*str | None*) –Data root for ann_cfg, *img_prefix*, *seg_prefix*, *proposal_file* if specified. Default: None.
- **test_mode** (*bool*) –If set True, annotation will not be loaded. Default: False.
- **filter_empty_gt** (*bool*) –If set true, images without bounding boxes of the dataset's classes will be filtered out. This option only works when *test_mode=False*, i.e., we never filter images during tests. Default: True.
- **min_bbox_size** (*int | float | None*) –The minimum size of bounding boxes in the images. If the size of a bounding box is less than *min_bbox_size*, it would be added to ignored field. Default: None.
- **ann_shot_filter** (*dict | None*) –Used to specify the class and the corresponding maximum number of instances when loading the annotation file. For example: { 'dog' : 10, 'person' : 5}. If set it as None, all annotation from ann file would be loaded. Default: None.
- **instance_wise** (*bool*) –If set true, *self.data_infos* would change to instance-wise, which means if the annotation of single image has more than one instance, the annotation would be split to *num_instances* items. Often used in support datasets, Default: False.
- **dataset_name** (*str | None*) –Name of dataset to display. For example: 'train_dataset' or 'query_dataset' . Default: None.

ann_cfg_parser (*ann_cfg: List[Dict]*) → List[Dict]

Parse annotation config to annotation information.

参数 **ann_cfg** (*list[dict]*) –Annotation config support two type of config.

- **'ann_file'** : loading annotation from common **ann_file** of dataset. example:
dict(type='ann_file', ann_file='path/to/ann_file', ann_classes=['dog', 'cat'])
- **'saved_dataset'** : loading annotation from saved dataset. example:dict(type='saved_dataset', ann_file='path/to/ann_file')

返回 Annotation information.

返回类型 list[dict]

get_ann_info (*idx: int*) → Dict

Get annotation by index.

When override this function please make sure same annotations are used during the whole training.

参数 **idx** (*int*) –Index of data.

返回 Annotation info of specified index.

返回类型 dict

load_annotations_saved (*ann_file: str*) → List[Dict]

Load data_infos from saved json.

prepare_train_img (*idx: int, pipeline_key: Optional[str] = None, gt_idx: Optional[List[int]] = None*) → Dict

Get training data and annotations after pipeline.

参数

- **idx** (*int*) –Index of data.
- **pipeline_key** (*str*) –Name of pipeline
- **gt_idx** (*list[int]*) –Index of used annotation.

返回 Training data and annotation after pipeline with new keys introduced by pipeline.

返回类型 dict

save_data_infos (*output_path: str*) → None

Save data_infos into json.

class mmfewshot.detection.datasets.**CropResizeInstance** (*num_context_pixels: int = 16, target_size: Tuple[int] = (320, 320)*)

Crop and resize instance according to bbox form image.

参数

- **num_context_pixels** (*int*) –Padding pixel around instance. Default: 16.
- **target_size** (*tuple[int, int]*) –Resize cropped instance to target size. Default: (320, 320).

```

class mmfewshot.detection.datasets.FewShotCocoDataset (classes:
    Optional[Union[Sequence[str], str]]
    = None, num_novel_shots:
    Optional[int] = None,
    num_base_shots: Optional[int] =
    None, ann_shot_filter:
    Optional[Dict[str, int]] = None,
    min_bbox_area:
    Optional[Union[float, int]] = None,
    dataset_name: Optional[str] = None,
    test_mode: bool = False, **kwargs)

```

COCO dataset for few shot detection.

参数

- **classes** (*str* | *Sequence[str]* | *None*) –Classes for model training and provide fixed label for each class. When classes is string, it will load pre-defined classes in *FewShotCocoDataset*. For example: ‘BASE_CLASSES’, ‘NOVEL_CLASSES’ or *ALL_CLASSES*.
- **num_novel_shots** (*int* | *None*) –Max number of instances used for each novel class. If is None, all annotation will be used. Default: None.
- **num_base_shots** (*int* | *None*) –Max number of instances used for each base class. If is None, all annotation will be used. Default: None.
- **ann_shot_filter** (*dict* | *None*) –Used to specify the class and the corresponding maximum number of instances when loading the annotation file. For example: { ‘dog’ : 10, ‘person’ : 5}. If set it as None, *ann_shot_filter* will be created according to *num_novel_shots* and *num_base_shots*.
- **min_bbox_area** (*int* | *float* | *None*) –Filter images with bbox whose area smaller *min_bbox_area*. If set to None, skip this filter. Default: None.
- **dataset_name** (*str* | *None*) –Name of dataset to display. For example: ‘train dataset’ or ‘query dataset’. Default: None.
- **test_mode** (*bool*) –If set True, annotation will not be loaded. Default: False.

```

evaluate (results: List[Sequence], metric: Union[str, List[str]] = 'bbox', logger: Optional[object] = None,
    jsonfile_prefix: Optional[str] = None, classwise: bool = False, proposal_nums: Sequence[int] = (100,
    300, 1000), iou_thrs: Optional[Union[float, Sequence[float]]] = None, metric_items:
    Optional[Union[str, List[str]]] = None, class_splits: Optional[List[str]] = None) → Dict

```

Evaluation in COCO protocol and summary results of different splits of classes.

参数

- **results** (*list[list | tuple]*) –Testing results of the dataset.

- **metric** (*str* | *list[str]*) –Metrics to be evaluated. Options are ‘bbox’, ‘proposal’, ‘proposal_fast’. Default: ‘bbox’
- **logger** (*logging.Logger* | *None*) –Logger used for printing related information during evaluation. Default: None.
- **jsonfile_prefix** (*str* | *None*) –The prefix of json files. It includes the file path and the prefix of filename, e.g., “a/b/prefix”. If not specified, a temp file will be created. Default: None.
- **classwise** (*bool*) –Whether to evaluating the AP for each class.
- **proposal_nums** (*Sequence[int]*) –Proposal number used for evaluating recalls, such as `recall@100`, `recall@1000`. Default: (100, 300, 1000).
- **iou_thrs** (*Sequence[float]* | *float* | *None*) –IoU threshold used for evaluating recalls/mAPs. If set to a list, the average of all IoUs will also be computed. If not specified, [0.50, 0.55, 0.60, 0.65, 0.70, 0.75, 0.80, 0.85, 0.90, 0.95] will be used. Default: None.
- **metric_items** (*list[str]* | *str* | *None*) –Metric items that will be returned. If not specified, ['AR@100', 'AR@300', 'AR@1000', 'AR_s@1000', 'AR_m@1000', 'AR_l@1000'] will be used when `metric=='proposal'`, ['mAP', 'mAP_50', 'mAP_75', 'mAP_s', 'mAP_m', 'mAP_l'] will be used when `metric=='bbox'`.
- **class_splits** –(*list[str]* | *None*): Calculate metric of classes split in COCO_SPLIT. For example: [‘BASE_CLASSES’, ‘NOVEL_CLASSES’]. Default: None.

返回 COCO style evaluation metric.

返回类型 dict[str, float]

get_cat_ids (*idx: int*) → List[int]

Get category ids by index.

Overwrite the function in CocoDataset.

参数 **idx** (*int*) –Index of data.

返回 All categories in the image of specified index.

返回类型 list[int]

get_classes (*classes: Union[str, Sequence[str]]*) → List[str]

Get class names.

It supports to load pre-defined classes splits. The pre-defined classes splits are: [‘ALL_CLASSES’, ‘NOVEL_CLASSES’, ‘BASE_CLASSES’]

参数 **classes** (*str* | *Sequence[str]*) –Classes for model training and provide fixed label for each class. When classes is string, it will load pre-defined classes in *FewShotCocoDataset*.

For example: ‘NOVEL_CLASSES’ .

返回 list of class names.

返回类型 list[str]

load_annotations (*ann_cfg: List[Dict]*) → List[Dict]

Support to Load annotation from two type of ann_cfg.

- type of ‘ann_file’ : COCO-style annotation file.
- type of ‘saved_dataset’ : Saved COCO dataset json.

参数 **ann_cfg** (*list[dict]*) –Config of annotations.

返回 Annotation infos.

返回类型 list[dict]

load_annotations_coco (*ann_file: str*) → List[Dict]

Load annotation from COCO style annotation file.

参数 **ann_file** (*str*) –Path of annotation file.

返回 Annotation info from COCO api.

返回类型 list[dict]

class mmfewshot.detection.datasets.**FewShotVOCDataset** (*classes:*

*Optional[Union[Sequence[str], str]] = None, num_novel_shots: Optional[int] = None, num_base_shots: Optional[int] = None, ann_shot_filter: Optional[Dict] = None, use_difficult: bool = False, min_bbox_area: Optional[Union[float, int]] = None, dataset_name: Optional[str] = None, test_mode: bool = False, coordinate_offset: List[int] = [-1, -1, 0, 0], **kwargs)*

VOC dataset for few shot detection.

参数

- **classes** (*str | Sequence[str]*) –Classes for model training and provide fixed label for each class. When classes is string, it will load pre-defined classes in *FewShotVOCDataset*. For example: ‘NOVEL_CLASSES_SPLIT1’ .
- **num_novel_shots** (*int | None*) –Max number of instances used for each novel class. If is None, all annotation will be used. Default: None.

- **num_base_shots** (*int* | *None*) –Max number of instances used for each base class. When it is *None*, all annotations will be used. Default: *None*.
- **ann_shot_filter** (*dict* | *None*) –Used to specify the class and the corresponding maximum number of instances when loading the annotation file. For example: { ‘dog’ : 10, ‘person’ : 5}. If set it as *None*, *ann_shot_filter* will be created according to *num_novel_shots* and *num_base_shots*. Default: *None*.
- **use_difficult** (*bool*) –Whether use the difficult annotation or not. Default: *False*.
- **min_bbox_area** (*int* | *float* | *None*) –Filter images with bbox whose area smaller *min_bbox_area*. If set to *None*, skip this filter. Default: *None*.
- **dataset_name** (*str* | *None*) –Name of dataset to display. For example: ‘train dataset’ or ‘query dataset’ . Default: *None*.
- **test_mode** (*bool*) –If set *True*, annotation will not be loaded. Default: *False*.
- **coordinate_offset** (*list[int]*) –The bbox annotation will add the coordinate offsets which corresponds to [x_min, y_min, x_max, y_max] during training. For testing, the gt annotation will not be changed while the predict results will minus the coordinate offsets to inverse data loading logic in training. Default: [-1, -1, 0, 0].

evaluate (*results: List[Sequence]*, *metric: Union[str, List[str]] = ‘mAP’*, *logger: Optional[object] = None*, *proposal_nums: Sequence[int] = (100, 300, 1000)*, *iou_thr: Optional[Union[float, Sequence[float]]] = 0.5*, *class_splits: Optional[List[str]] = None*) → *Dict*

Evaluation in VOC protocol and summary results of different splits of classes.

参数

- **results** (*list[list | tuple]*) –Predictions of the model.
- **metric** (*str* | *list[str]*) –Metrics to be evaluated. Options are ‘mAP’, ‘recall’ . Default: mAP.
- **logger** (*logging.Logger* | *None*) –Logger used for printing related information during evaluation. Default: *None*.
- **proposal_nums** (*Sequence[int]*) –Proposal number used for evaluating recalls, such as *recall@100*, *recall@1000*. Default: (100, 300, 1000).
- **iou_thr** (*float* | *list[float]*) –IoU threshold. Default: 0.5.
- **class_splits** –(*list[str]* | *None*): Calculate metric of classes split defined in *VOC_SPLIT*. For example: [‘BASE_CLASSES_SPLIT1’, ‘NOVEL_CLASSES_SPLIT1’]. Default: *None*.

返回 AP/recall metrics.

返回类型 *dict[str, float]*

get_classes (*classes: Union[str, Sequence[str]]*) → List[str]

Get class names.

It supports to load pre-defined classes splits. The pre-defined classes splits are: ['ALL_CLASSES_SPLIT1', 'ALL_CLASSES_SPLIT2', 'ALL_CLASSES_SPLIT3', 'BASE_CLASSES_SPLIT1', 'BASE_CLASSES_SPLIT2', 'BASE_CLASSES_SPLIT3', 'NOVEL_CLASSES_SPLIT1', 'NOVEL_CLASSES_SPLIT2', 'NOVEL_CLASSES_SPLIT3']

参数 classes (*str | Sequence[str]*)—Classes for model training and provide fixed label for each class. When classes is string, it will load pre-defined classes in *FewShotVOCDataset*. For example: 'NOVEL_CLASSES_SPLIT1' .

返回 List of class names.

返回类型 list[str]

load_annotations (*ann_cfg: List[Dict]*) → List[Dict]

Support to load annotation from two type of ann_cfg.

参数

- **ann_cfg** (*list[dict]*)—Support two type of config.
- **loading annotation from common ann_file of dataset** (-) —with or without specific classes. example:dict(type=' ann_file' , ann_file=' path/to/ann_file' , ann_classes=['dog' , 'cat'])
- **loading annotation from a json file saved by dataset.** (-) —example:dict(type=' saved_dataset' , ann_file=' path/to/ann_file')

返回 Annotation information.

返回类型 list[dict]

load_annotations_xml (*ann_file: str, classes: Optional[List[str]] = None*) → List[Dict]

Load annotation from XML style ann_file.

It supports using image id or image path as image names to load the annotation file.

参数

- **ann_file** (*str*)—Path of annotation file.
- **classes** (*list[str] | None*)—Specific classes to load form xml file. If set to None, it will use classes of whole dataset. Default: None.

返回 Annotation info from XML file.

返回类型 list[dict]

class mmfewshot.detection.datasets.**GenerateMask** (*target_size: Tuple[int] = (224, 224)*)

Resize support image and generate a mask.

参数 **target_size** (*tuple[int, int]*) –Crop and resize to target size. Default: (224, 224).

class mmfewshot.detection.datasets.**NWayKShotDataLoader** (*query_data_loader: torch.utils.data.dataloader.DataLoader, support_data_loader: torch.utils.data.dataloader.DataLoader*)

A dataloader wrapper.

It Create a iterator to generate query and support batch simultaneously. Each batch contains query data and support data, and the lengths are batch_size and (num_support_ways * num_support_shots) respectively.

参数

- **query_data_loader** (*DataLoader*) –DataLoader of query dataset
- **support_data_loader** (*DataLoader*) –DataLoader of support datasets.

class mmfewshot.detection.datasets.**NWayKShotDataset** (*query_dataset: mmfewshot.detection.datasets.base.BaseFewShotDataset, support_dataset: Optional[mmfewshot.detection.datasets.base.BaseFewShotDataset], num_support_ways: int, num_support_shots: int, one_support_shot_per_image: bool = False, num_used_support_shots: int = 200, repeat_times: int = 1*)

A dataset wrapper of NWayKShotDataset.

Building NWayKShotDataset requires query and support dataset, the behavior of NWayKShotDataset is determined by *mode*. When dataset in ‘query’ mode, dataset will return regular image and annotations. While dataset in ‘support’ mode, dataset will build batch indices firstly and each batch indices contain (num_support_ways * num_support_shots) samples. In other words, for support mode every call of `__getitem__` will return a batch of samples, therefore the outside dataloader should set batch_size to 1. The default *mode* of NWayKShotDataset is ‘query’ and by using convert function `convert_query_to_support` the *mode* will be converted into ‘support’ .

参数

- **query_dataset** (*BaseFewShotDataset*) –Query dataset to be wrapped.
- **support_dataset** (*BaseFewShotDataset | None*) –Support dataset to be wrapped. If support dataset is None, support dataset will copy from query dataset.
- **num_support_ways** (*int*) –Number of classes for support in mini-batch.
- **num_support_shots** (*int*) –Number of support shot for each class in mini-batch.

- **one_support_shot_per_image** (*bool*) –If True only one annotation will be sampled from each image. Default: False.
- **num_used_support_shots** (*int | None*) –The total number of support shots sampled and used for each class during training. If set to None, all shots in dataset will be used as support shot. Default: 200.
- **shuffle_support** (*bool*) –If allow generate new batch indices for each epoch. Default: False.
- **repeat_times** (*int*) –The length of repeated dataset will be *times* larger than the original dataset. Default: 1.

convert_query_to_support (*support_dataset_len: int*) → None

Convert query dataset to support dataset.

参数 **support_dataset_len** (*int*) –Length of pre sample batch indices.

generate_support_batch_indices (*dataset_len: int*) → List[List[Tuple[int]]]

Generate batch indices from support dataset.

Batch indices is in the shape of [length of datasets * [support way * support shots]]. And the *dataset_len* will be the length of support dataset.

参数 **dataset_len** (*int*) –Length of batch indices.

返回 Pre-sample batch indices.

返回类型 list[list[(data_idx, gt_idx)]]

get_support_data_infos () → List[Dict]

Get support data infos from batch indices.

save_data_infos (*output_path: str*) → None

Save data infos of query and support data.

save_support_data_infos (*support_output_path: str*) → None

Save support data infos.

```
class mmfewshot.detection.datasets.NumpyEncoder (*, skipkeys=False, ensure_ascii=True,
                                                check_circular=True, allow_nan=True,
                                                sort_keys=False, indent=None,
                                                separators=None, default=None)
```

Save numpy array obj to json.

default (*obj: object*) → object

Implement this method in a subclass such that it returns a serializable object for o, or calls the base implementation (to raise a `TypeError`).

For example, to support arbitrary iterators, you could implement default like this:

```

def default(self, o):
    try:
        iterable = iter(o)
    except TypeError:
        pass
    else:
        return list(iterable)
    # Let the base class default method raise the TypeError
    return JSONEncoder.default(self, o)

```

class mmfewshot.detection.datasets.**QueryAwareDataset** (*query_dataset: mmfewshot.detection.datasets.base.BaseFewShotDataset, support_dataset: Optional[mmfewshot.detection.datasets.base.BaseFewShotDataset], num_support_ways: int, num_support_shots: int, repeat_times: int = 1*)

A wrapper of QueryAwareDataset.

Building QueryAwareDataset requires query and support dataset. Every call of `__getitem__` will firstly sample a query image and its annotations. Then it will use the query annotations to sample a batch of positive and negative support images and annotations. The positive images share same classes with query, while the annotations of negative images don't have any category from query.

参数

- **query_dataset** (*BaseFewShotDataset*) –Query dataset to be wrapped.
- **support_dataset** (*BaseFewShotDataset | None*) –Support dataset to be wrapped. If support dataset is None, support dataset will copy from query dataset.
- **num_support_ways** (*int*) –Number of classes for support in mini-batch, the first one always be the positive class.
- **num_support_shots** (*int*) –Number of support shots for each class in mini-batch, the first K shots always from positive class.
- **repeat_times** (*int*) –The length of repeated dataset will be *times* larger than the original dataset. Default: 1.

generate_support (*idx: int, query_class: int, support_classes: List[int]*) → List[Tuple[int]]

Generate support indices of query images.

参数

- **idx** (*int*) –Index of query data.
- **query_class** (*int*) –Query class.

- **support_classes** (*list[int]*) –Classes of support data.

返回

A mini-batch (**num_support_ways** * **num_support_shots**) of support data (*idx*, *gt_idx*).

返回类型 `list[tuple(int)]`

get_support_data_infos () → `List[Dict]`

Return `data_infos` of support dataset.

sample_support_shots (*idx: int, class_id: int, allow_same_image: bool = False*) → `List[Tuple[int]]`

Generate support indices according to the class id.

参数

- **idx** (*int*) –Index of query data.
- **class_id** (*int*) –Support class.
- **allow_same_image** (*bool*) –Allow instance sampled from same image as query image. Default: `False`.

返回

Support data (**num_support_shots**) of specific class.

返回类型 `list[tuple[int]]`

save_data_infos (*output_path: str*) → `None`

Save `data_infos` into json.

`mmfewshot.detection.datasets.build_data_loader` (*dataset: torch.utils.data.dataset.Dataset, samples_per_gpu: int, workers_per_gpu: int, num_gpus: int = 1, dist: bool = True, shuffle: bool = True, seed: Optional[int] = None, data_cfg: Optional[Dict] = None, use_infinite_sampler: bool = False, **kwargs*) → `torch.utils.data.dataloader.DataLoader`

Build PyTorch `DataLoader`.

In distributed training, each GPU/process has a `dataloader`. In non-distributed training, there is only one `dataloader` for all GPUs.

参数

- **dataset** (*Dataset*) –A PyTorch dataset.
- **samples_per_gpu** (*int*) –Number of training samples on each GPU, i.e., batch size of each GPU.
- **workers_per_gpu** (*int*) –How many subprocesses to use for data loading for each GPU.
- **num_gpus** (*int*) –Number of GPUs. Only used in non-distributed training. Default: 1.

- **dist** (*bool*) –Distributed training/test or not. Default: True.
- **shuffle** (*bool*) –Whether to shuffle the data at every epoch. Default: True.
- **seed** (*int*) –Random seed. Default:None.
- **data_cfg** (*dict | None*) –Dict of data configure. Default: None.
- **use_infinite_sampler** (*bool*) –Whether to use infinite sampler. Noted that infinite sampler will keep iterator of dataloader running forever, which can avoid the overhead of worker initialization between epochs. Default: False.
- **kwargs** –any keyword argument to be used to initialize DataLoader

返回 A PyTorch dataloader.

返回类型 DataLoader

`mmfewshot.detection.datasets.get_copy_dataset_type(dataset_type: str) → str`
Return corresponding copy dataset type.

23.4 detection.models

`mmfewshot.detection.models.build_backbone(cfg)`

Build backbone.

`mmfewshot.detection.models.build_detector(cfg: mmcv.utils.config.ConfigDict, logger: Optional[object] = None)`

Build detector.

`mmfewshot.detection.models.build_head(cfg)`

Build head.

`mmfewshot.detection.models.build_loss(cfg)`

Build loss.

`mmfewshot.detection.models.build_neck(cfg)`

Build neck.

`mmfewshot.detection.models.build_roi_extractor(cfg)`

Build roi extractor.

`mmfewshot.detection.models.build_shared_head(cfg)`

Build shared head.

23.4.1 backbones

class mmfewshot.detection.models.backbones.**ResNetWithMetaConv** (**kwargs)

ResNet with *meta_conv* to handle different inputs in metarcnn and fsdetview.

When input with shape (N, 3, H, W) from images, the network will use *conv1* as regular ResNet. When input with shape (N, 4, H, W) from (image + mask) the network will replace *conv1* with *meta_conv* to handle additional channel.

forward (*x*: torch.Tensor, *use_meta_conv*: bool = False) → Tuple[torch.Tensor]

Forward function.

When input with shape (N, 3, H, W) from images, the network will use *conv1* as regular ResNet. When input with shape (N, 4, H, W) from (image + mask) the network will replace *conv1* with *meta_conv* to handle additional channel.

参数

- **x** (*Tensor*) – Tensor with shape (N, 3, H, W) from images or (N, 4, H, W) from (images + masks).
- **use_meta_conv** (*bool*) – If set True, forward input tensor with *meta_conv* which require tensor with shape (N, 4, H, W). Otherwise, forward input tensor with *conv1* which require tensor with shape (N, 3, H, W). Default: False.

返回

Tuple of features, each item with shape (N, C, H, W).

返回类型 tuple[Tensor]

23.4.2 dense_heads

```
class mmfewshot.detection.models.dense_heads.AttentionRPNHead (num_support_ways: int,
                                                            num_support_shots: int,
                                                            aggregation_layer: Dict
                                                            = {'aggregator_cfgs':
                                                              [{'type': 'DepthWiseCorrelationAggregator',
                                                                'in_channels': 1024,
                                                                'with_fc': False}], 'type':
                                                              'AggregationLayer'},
                                                            roi_extractor: Dict =
                                                            {'featmap_strides': [16],
                                                              'out_channels': 1024,
                                                              'roi_layer':
                                                                {'output_size': 14,
                                                                 'sampling_ratio': 0,
                                                                 'type': 'RoIAlign'}, 'type':
                                                              'SingleRoIExtractor'},
                                                            **kwargs)
```

RPN head for [Attention RPN](#).

参数

- **num_support_ways** (*int*) –Number of sampled classes (pos + neg).
- **num_support_shots** (*int*) –Number of shot for each classes.
- **aggregation_layer** (*dict*) –Config of *aggregation_layer*.
- **roi_extractor** (*dict*) –Config of *roi_extractor*.

extract_roi_feat (*feats: List[torch.Tensor], rois: torch.Tensor*) → torch.Tensor

Forward function.

参数

- **feats** (*list [Tensor]*) –Input features with shape (N, C, H, W).
- **rois** –with shape (m, 5).

forward_train (*query_feats: List[torch.Tensor], support_feats: List[torch.Tensor], query_gt_bboxes: List[torch.Tensor], query_img metas: List[Dict], support_gt_bboxes: List[torch.Tensor], query_gt_bboxes_ignore: Optional[List[torch.Tensor]] = None, proposal_cfg: Optional[mmcv.utils.config.ConfigDict] = None, **kwargs*) → Tuple[Dict, List[Tuple]]

Forward function in training phase.

参数

- **query_feats** (*list[Tensor]*) –List of query features, each item with shape (N, C, H, W)..
- **support_feats** (*list[Tensor]*) –List of support features, each item with shape (N, C, H, W).
- **query_gt_bboxes** (*list[Tensor]*) –List of ground truth bboxes of query image, each item with shape (num_gts, 4).
- **query_img metas** (*list[dict]*) –List of query image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys see `mmdet.datasets.pipelines.Collect`.
- **support_gt_bboxes** (*list[Tensor]*) –List of ground truth bboxes of support image, each item with shape (num_gts, 4).
- **query_gt_bboxes_ignore** (*list[Tensor]*) –List of ground truth bboxes to be ignored of query image with shape (num_ignored_gts, 4). Default: None.
- **proposal_cfg** (`ConfigDict`) –Test / postprocessing configuration. if None, `test_cfg` would be used. Default: None.

返回

loss components and proposals of each image.

- `losses`: (`dict[str, Tensor]`): A dictionary of loss components.
- `proposal_list` (`list[Tensor]`): Proposals of each image.

返回类型 tuple

loss (*cls_scores: List[torch.Tensor]*, *bbox_preds: List[torch.Tensor]*, *gt_bboxes: List[torch.Tensor]*, *img_metas: List[Dict]*, *gt_labels: Optional[List[torch.Tensor]] = None*, *gt_bboxes_ignore: Optional[List[torch.Tensor]] = None*, *pair_flags: Optional[List[bool]] = None*) → `Dict`

Compute losses of rpn head.

参数

- **cls_scores** (*list[Tensor]*) –Box scores for each scale level with shape (N, num_anchors * num_classes, H, W)
- **bbox_preds** (*list[Tensor]*) –Box energies / deltas for each scale level with shape (N, num_anchors * 4, H, W)
- **gt_bboxes** (*list[Tensor]*) –Ground truth bboxes for each image with shape (num_gts, 4) in [tl_x, tl_y, br_x, br_y] format.
- **img_metas** (*list[dict]*) –list of image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys see `mmdet.datasets.pipelines.Collect`.

- **gt_labels** (*list [Tensor]*) –Class indices corresponding to each box. Default: None.
- **gt_bboxes_ignore** (*None | list [Tensor]*) –Specify which bounding boxes can be ignored when computing the loss. Default: None
- **pair_flags** (*list [bool]*) –Indicate predicted result is from positive pair or negative pair with shape (N). Default: None.

返回 A dictionary of loss components.

返回类型 dict[str, Tensor]

simple_test (*query_feats: List[torch.Tensor], support_feat: torch.Tensor, query_img metas: List[Dict], rescale: bool = False*) → List[torch.Tensor]

Test function without test time augmentation.

参数

- **query_feats** (*list [Tensor]*) –List of query features, each item with shape(N, C, H, W).
- **support_feat** (*Tensor*) –Support features with shape (N, C, H, W).
- **query_img metas** (*list [dict]*) –List of query image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys see `mmdet.datasets.pipelines.Collect`.
- **rescale** (*bool*) –Whether to rescale the results. Default: False.

返回

Proposals of each image, each item has shape (n, 5), where 5 represent (tl_x, tl_y, br_x, br_y, score).

返回类型 List[Tensor]

class `mmfewshot.detection.models.dense_heads.TwoBranchRPNHead` (*mid_channels: int = 64, **kwargs*)

RPN head for MPSR.

参数 **mid_channels** (*int*) –Input channels of *rpn_cls_conv*. Default: 64.

forward_auxiliary (*feats: List[torch.Tensor]*) → List[torch.Tensor]

Forward auxiliary features at multiple scales.

参数 **feats** (*list [Tensor]*) –List of features at multiple scales, each is a 4D-tensor.

返回

Classification scores for all scale levels, each is a 4D-tensor, the channels number is `num_anchors * num_classes`.

返回类型 list[Tensor]

forward_auxiliary_single (*feat: torch.Tensor*) → Tuple[torch.Tensor]

Forward auxiliary feature map of a single scale level.

forward_single (*feat: torch.Tensor*) → Tuple[torch.Tensor, torch.Tensor]

Forward feature map of a single scale level.

forward_train (*x: List[torch.Tensor], auxiliary_rpn_feats: List[torch.Tensor], img metas: List[Dict], gt_bboxes: List[torch.Tensor], gt_labels: Optional[List[torch.Tensor]] = None, gt_bboxes_ignore: Optional[List[torch.Tensor]] = None, proposal_cfg: Optional[mmcv.utils.config.ConfigDict] = None, **kwargs*) → Tuple[Dict, List[torch.Tensor]]

参数

- **x** (*list [Tensor]*) –Features from FPN, each item with shape (N, C, H, W).
- **auxiliary_rpn_feats** (*list [Tensor]*) –Auxiliary features from FPN, each item with shape (N, C, H, W).
- **img_metas** (*list [dict]*) –Meta information of each image, e.g., image size, scaling factor, etc.
- **gt_bboxes** (*list [Tensor]*) –Ground truth bboxes of the image, shape (num_gts, 4).
- **gt_labels** (*list [Tensor]*) –Ground truth labels of each box, shape (num_gts,). Default: None.
- **gt_bboxes_ignore** (*list [Tensor]*) –Ground truth bboxes to be ignored, shape (num_ignored_gts, 4). Default: None.
- **proposal_cfg** (*ConfigDict*) –Test / postprocessing configuration, if None, test_cfg would be used. Default: None.

返回 losses: (dict[str, Tensor]): A dictionary of loss components. proposal_list (List[Tensor]): Proposals of each image.

返回类型 tuple

get_bboxes (*cls_scores: List[torch.Tensor], bbox_preds: List[torch.Tensor], img_metas: List[Dict], cfg: Optional[mmcv.utils.config.ConfigDict] = None, rescale: bool = False, with_nms: bool = True*) → List[torch.Tensor]

Transform network output for a batch into bbox predictions.

参数

- **cls_scores** (*list [Tensor]*) –Box scores for each scale level Has shape (N, num_anchors * num_classes, H, W)
- **bbox_preds** (*list [Tensor]*) –Box energies / deltas for each scale level with shape (N, num_anchors * 4, H, W)

- **img metas** (*list[dict]*) –Meta information of each image, e.g., image size, scaling factor, etc.
- **cfg** (*ConfigDict | None*) –Test / postprocessing configuration, if None, test_cfg would be used
- **rescale** (*bool*) –If True, return boxes in original image space. Default: False.
- **with_nms** (*bool*) –If True, do nms before return boxes. Default: True.

返回

Proposals of each image, each item has shape (n, 5), where 5 represent (tl_x, tl_y, br_x, br_y, score).

返回类型 List[Tensor]

loss (*cls_scores: List[torch.Tensor], bbox_preds: List[torch.Tensor], gt_bboxes: List[torch.Tensor], gt_labels: List[torch.Tensor], img_metas: List[Dict], gt_bboxes_ignore: Optional[List[torch.Tensor]] = None, auxiliary_cls_scores: Optional[List[torch.Tensor]] = None*) → Dict

Compute losses of the head.

参数

- **cls_scores** (*list[Tensor]*) –Box scores for each scale level, each item with shape (N, num_anchors * num_classes, H, W).
- **bbox_preds** (*list[Tensor]*) –Box energies / deltas for each scale level with shape (N, num_anchors * 4, H, W)
- **gt_bboxes** (*list[Tensor]*) –Ground truth bboxes for each image with shape (num_gts, 4) in [tl_x, tl_y, br_x, br_y] format.
- **gt_labels** (*list[Tensor]*) –class indices corresponding to each box
- **img_metas** (*list[dict]*) –Meta information of each image, e.g., image size, scaling factor, etc.
- **gt_bboxes_ignore** (*list[Tensor] | None*) –specify which bounding boxes can be ignored when computing the loss. Default: None.
- **auxiliary_cls_scores** (*list[Tensor] | None*) –Box scores for each scale level, each item with shape (N, num_anchors * num_classes, H, W). Default: None.

返回 A dictionary of loss components.

返回类型 dict[str, Tensor]

loss_bbox_single (*bbox_pred: torch.Tensor, anchors: torch.Tensor, bbox_targets: torch.Tensor, bbox_weights: torch.Tensor, num_total_samples: int*) → Tuple[Dict]

Compute loss of a single scale level.

参数

- **bbbox_pred** (*Tensor*) –Box energies / deltas for each scale level with shape (N, num_anchors * 4, H, W).
- **anchors** (*Tensor*) –Box reference for each scale level with shape (N, num_total_anchors, 4).
- **bbbox_targets** (*Tensor*) –BBox regression targets of each anchor weight shape (N, num_total_anchors, 4).
- **bbbox_weights** (*Tensor*) –BBox regression loss weights of each anchor with shape (N, num_total_anchors, 4).
- **num_total_samples** (*int*) –If sampling, num total samples equal to the number of total anchors; Otherwise, it is the number of positive anchors.

返回 A dictionary of loss components.

返回类型 tuple[dict[str, Tensor]]

loss_cls_single (*cls_score: torch.Tensor, labels: torch.Tensor, label_weights: torch.Tensor, num_total_samples: int*) → Tuple[Dict]

Compute loss of a single scale level.

参数

- **cls_score** (*Tensor*) –Box scores for each scale level Has shape (N, num_anchors * num_classes, H, W).
- **labels** (*Tensor*) –Labels of each anchors with shape (N, num_total_anchors).
- **label_weights** (*Tensor*) –Label weights of each anchor with shape (N, num_total_anchors)
- **num_total_samples** (*int*) –If sampling, num total samples equal to the number of total anchors; Otherwise, it is the number of positive anchors.

返回 A dictionary of loss components.

返回类型 tuple[dict[str, Tensor]]

23.4.3 detectors

```

class mmfewshot.detection.models.detectors.AttentionRPNDetector (backbone:
    mmcv.utils.config.ConfigDict,
    neck: Op-
    tional[mmcv.utils.config.ConfigDict]
    = None,
    support_backbone:
    Op-
    tional[mmcv.utils.config.ConfigDict]
    = None,
    support_neck: Op-
    tional[mmcv.utils.config.ConfigDict]
    = None, rpn_head:
    Op-
    tional[mmcv.utils.config.ConfigDict]
    = None, roi_head:
    Op-
    tional[mmcv.utils.config.ConfigDict]
    = None, train_cfg:
    Op-
    tional[mmcv.utils.config.ConfigDict]
    = None, test_cfg: Op-
    tional[mmcv.utils.config.ConfigDict]

    Op-
    tional[mmcv.utils.config.ConfigDict]
    = None, init_cfg: Op-
    tional[mmcv.utils.config.ConfigDict]
    = None)

```

Implementation of [AttentionRPN](#).

参数

- **backbone** (*dict*) –Config of the backbone for query data.
- **neck** (*dict* | *None*) –Config of the neck for query data and probably for support data. Default: *None*.
- **support_backbone** (*dict* | *None*) –Config of the backbone for support data only. If *None*, support and query data will share same backbone. Default: *None*.
- **support_neck** (*dict* | *None*) –Config of the neck for support data only. Default: *None*.

- **rpn_head** (*dict* | *None*) –Config of rpn_head. Default: None.
- **roi_head** (*dict* | *None*) –Config of roi_head. Default: None.
- **train_cfg** (*dict* | *None*) –Training config. Useless in CenterNet, but we keep this variable for SingleStageDetector. Default: None.
- **test_cfg** (*dict* | *None*) –Testing config of CenterNet. Default: None.
- **pretrained** (*str* | *None*) –model pretrained path. Default: None.
- **init_cfg** (*dict* | *list[dict]* | *None*) –Initialization config dict. Default: None.

extract_support_feat (*img: torch.Tensor*) → List[torch.Tensor]

Extract features of support data.

参数 **img** (*Tensor*) –Input images of shape (N, C, H, W). Typically these should be mean centered and std scaled.

返回

Features of support images, each item with shape (N, C, H, W).

返回类型 list[Tensor]

forward_model_init (*img: torch.Tensor, img metas: List[Dict], gt_bboxes: Optional[List[torch.Tensor]] = None, gt_labels: Optional[List[torch.Tensor]] = None, **kwargs*) → Dict

Extract and save support features for model initialization.

参数

- **img** (*Tensor*) –Input images of shape (N, C, H, W). Typically these should be mean centered and std scaled.
- **img_metas** (*list[dict]*) –list of image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys see `mmdet.datasets.pipelines.Collect`.
- **gt_bboxes** (*list[Tensor]*) –Ground truth bboxes for each image with shape (num_gts, 4) in [tl_x, tl_y, br_x, br_y] format.
- **gt_labels** (*list[Tensor]*) –class indices corresponding to each box.

返回

A dict contains following keys:

- **gt_labels** (Tensor): **class indices corresponding to each** feature.
- **res4_roi_feat** (Tensor): roi features of res4 layer.
- **res5_roi_feat** (Tensor): roi features of res5 layer.

返回类型 dict

`model_init()` → None

process the saved support features for model initialization.

`simple_test` (*img*: *torch.Tensor*, *img metas*: *List[Dict]*, *proposals*: *Optional[List[torch.Tensor]] = None*,
rescale: *bool = False*) → *List[List[[numpy.ndarray](#)]]*

Test without augmentation.

参数

- **img** (*Tensor*) –Input images of shape (N, C, H, W). Typically these should be mean centered and std scaled.
- **img metas** (*list[dict]*) –list of image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys see `mmdet.datasets.pipelines.Collect`.
- **proposals** (*list[Tensor] | None*) –override rpn proposals with custom proposals. Use when *with_rpn* is False. Default: None.
- **rescale** (*bool*) –If True, return boxes in original image space.

返回

BBox results of each image and classes. The outer list corresponds to each image. The inner list corresponds to each class.

返回类型 `list[list[np.ndarray]]`

`class` `mmfewshot.detection.models.detectors.FSCE` (*backbone*, *neck=None*, *rpn_head=None*,
roi_head=None, *train_cfg=None*,
test_cfg=None, *pretrained=None*,
init_cfg=None)

Implementation of [FSCE](#)

```

class mmfewshot.detection.models.detectors.FSDetView (backbone:
    mmcv.utils.config.ConfigDict, neck:
    Optional[mmcv.utils.config.ConfigDict]
    = None, support_backbone:
    Optional[mmcv.utils.config.ConfigDict]
    = None, support_neck:
    Optional[mmcv.utils.config.ConfigDict]
    = None, rpn_head:
    Optional[mmcv.utils.config.ConfigDict]
    = None, roi_head:
    Optional[mmcv.utils.config.ConfigDict]
    = None, train_cfg:
    Optional[mmcv.utils.config.ConfigDict]
    = None, test_cfg:
    Optional[mmcv.utils.config.ConfigDict]
    = None, pretrained:
    Optional[mmcv.utils.config.ConfigDict]
    = None, init_cfg:
    Optional[mmcv.utils.config.ConfigDict]
    = None)

```

Implementation of `FSDetView`.

```

class mmfewshot.detection.models.detectors.MPSR (rpn_select_levels: List[int], roi_select_levels:
    List[int], *args, **kwargs)

```

Implementation of `MPSR`.

参数

- **rpn_select_levels** (*list[int]*) –Specify the corresponding level of fpn features for each scale of image. The selected features will be fed into rpn head.
- **roi_select_levels** (*list[int]*) –Specific which level of fpn features to be selected for each scale of image. The selected features will be fed into roi head.

```

extract_auxiliary_feat (auxiliary_img_list: List[torch.Tensor]) → Tuple[List[torch.Tensor],
    List[torch.Tensor]]

```

Extract and select features from data list at multiple scale.

参数 `auxiliary_img_list` (*list[Tensor]*) –List of data at different scales. In most cases, each dict contains: `img`, `img metas`, `gt_bboxes`, `gt_labels`, `gt_bboxes_ignore`.

返回

rpn_feats (*list[Tensor]*): **Features at multiple scale used** for rpn head training.

roi_feats (*list[Tensor]*): **Features at multiple scale used** for roi head training.

返回类型 tuple

extract_feat (*img: torch.Tensor*) → List[torch.Tensor]

Directly extract features from the backbone+neck.

forward (*main_data: Dict = None, auxiliary_data: Dict = None, img: List[torch.Tensor] = None, img metas: List[Dict] = None, return_loss: bool = True, **kwargs*) → Dict

Calls either `forward_train()` or `forward_test()` depending on whether `return_loss` is True.

Note this setting will change the expected inputs. When `return_loss=True`, the input will be `main` and `auxiliary` data for training, and when `return_loss=False`, the input will be `img` and `img meta` for testing.

参数

- **main_data** (*dict*) –Used for `forward_train()`. Dict of data and data info, where each dict has: `img`, `img_metas`, `gt_bboxes`, `gt_labels`, `gt_bboxes_ignore`. Default: None.
- **auxiliary_data** (*dict*) –Used for `forward_train()`. Dict of data and data info at multiple scales, where each key use different suffix to indicate different scale. For example, `img_scale_i`, `img_metas_scale_i`, `gt_bboxes_scale_i`, `gt_labels_scale_i`, `gt_bboxes_ignore_scale_i`, where `i` in range of 0 to number of scales. Default: None.
- **img** (*list[Tensor]*) –Used for func:`forward_test` or `forward_model_init()`. List of tensors of shape (1, C, H, W). Typically these should be mean centered and std scaled. Default: None.
- **img_metas** (*list[dict]*) –Used for func:`forward_test` or `forward_model_init()`. List of image info dict where each dict has: `img_shape`, `scale_factor`, `flip`, and may also contain `filename`, `ori_shape`, `pad_shape`, and `img_norm_cfg`. For details on the values of these keys, see `mmdet.datasets.pipelines.Collect`. Default: None.
- **return_loss** (*bool*) –If set True call `forward_train()`, otherwise call `forward_test()`. Default: True.

forward_train (*main_data: Dict, auxiliary_data_list: List[Dict], **kwargs*) → Dict

参数

- **main_data** (*dict*) –In most cases, dict of main data contains: `img`, `img_metas`, `gt_bboxes`, `gt_labels`, `gt_bboxes_ignore`.
- **auxiliary_data_list** (*list[dict]*) –List of data at different scales. In most cases, each dict contains: `img`, `img_metas`, `gt_bboxes`, `gt_labels`, `gt_bboxes_ignore`.

返回 a dictionary of loss components

返回类型 dict[str, Tensor]

train_step (*data: Dict, optimizer: Union[object, Dict]*) → Dict

The iteration step during training.

This method defines an iteration step during training, except for the back propagation and optimizer updating, which are done in an optimizer hook. Note that in some complicated cases or models, the whole process including back propagation and optimizer updating is also defined in this method, such as GAN.

参数

- **data** (*dict*) –The output of dataloader.
- **optimizer** (`torch.optim.Optimizer` | *dict*) –The optimizer of runner is passed to `train_step()`. This argument is unused and reserved.

返回

It should contain at least 3 keys: `loss`, `log_vars`, `num_samples`.

- `loss` is a tensor for back propagation, which can be a weighted sum of multiple losses.
- `log_vars` contains all the variables to be sent to the logger. - `num_samples` indicates the batch size (when the model is DDP, it means the batch size on each GPU), which is used for averaging the logs.

返回类型 dict

val_step (*data: Dict, optimizer: Optional[Union[object, Dict]] = None*) → Dict

The iteration step during validation.

This method shares the same signature as `train_step()`, but used during val epochs. Note that the evaluation after training epochs is not implemented with this method, but an evaluation hook.

```

class mmfewshot.detection.models.detectors.MetaRCNN (backbone: mmcv.utils.config.ConfigDict,
                                                    neck:
                                                    Optional[mmcv.utils.config.ConfigDict]
                                                    = None, support_backbone:
                                                    Optional[mmcv.utils.config.ConfigDict]
                                                    = None, support_neck:
                                                    Optional[mmcv.utils.config.ConfigDict]
                                                    = None, rpn_head:

                                                    = None, roi_head:
                                                    Optional[mmcv.utils.config.ConfigDict]
                                                    = None, train_cfg:
                                                    Optional[mmcv.utils.config.ConfigDict]
                                                    = None, test_cfg:
                                                    Optional[mmcv.utils.config.ConfigDict]
                                                    = None, pretrained:
                                                    Optional[mmcv.utils.config.ConfigDict]
                                                    = None, init_cfg:
                                                    Optional[mmcv.utils.config.ConfigDict]
                                                    = None)

```

Implementation of [Meta R-CNN](#).

参数

- **backbone** (*dict*) –Config of the backbone for query data.
- **neck** (*dict* | *None*) –Config of the neck for query data and probably for support data. Default: *None*.
- **support_backbone** (*dict* | *None*) –Config of the backbone for support data only. If *None*, support and query data will share same backbone. Default: *None*.
- **support_neck** (*dict* | *None*) –Config of the neck for support data only. Default: *None*.
- **rpn_head** (*dict* | *None*) –Config of rpn_head. Default: *None*.
- **roi_head** (*dict* | *None*) –Config of roi_head. Default: *None*.
- **train_cfg** (*dict* | *None*) –Training config. Useless in CenterNet, but we keep this variable for SingleStageDetector. Default: *None*.
- **test_cfg** (*dict* | *None*) –Testing config of CenterNet. Default: *None*.
- **pretrained** (*str* | *None*) –model pretrained path. Default: *None*.
- **init_cfg** (*dict* | *list[dict]* | *None*) –Initialization config dict. Default: *None*

extract_support_feat (*img*)

Extracting features from support data.

参数 **img** (*Tensor*) –Input images of shape (N, C, H, W). Typically these should be mean centered and std scaled.

返回

Features of input image, each item with shape (N, C, H, W).

返回类型 list[*Tensor*]

forward_model_init (*img: torch.Tensor, img metas: List[Dict], gt_bboxes: Optional[List[torch.Tensor]] = None, gt_labels: Optional[List[torch.Tensor]] = None, **kwargs*)

extract and save support features for model initialization.

参数

- **img** (*Tensor*) –Input images of shape (N, C, H, W). Typically these should be mean centered and std scaled.
- **img_metas** (*list[dict]*) –list of image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys see `mmdet.datasets.pipelines.Collect`.
- **gt_bboxes** (*list[Tensor]*) –Ground truth bboxes for each image with shape (num_gts, 4) in [tl_x, tl_y, br_x, br_y] format.
- **gt_labels** (*list[Tensor]*) –class indices corresponding to each box.

返回

A dict contains following keys:

- **gt_labels** (*Tensor*): **class indices corresponding to each** feature.
- *res5_rois* (*list[Tensor]*): roi features of res5 layer.

返回类型 dict

model_init ()

process the saved support features for model initialization.

simple_test (*img: torch.Tensor, img metas: List[Dict], proposals: Optional[List[torch.Tensor]] = None, rescale: bool = False*)

Test without augmentation.

参数

- **img** (*Tensor*) –Input images of shape (N, C, H, W). Typically these should be mean centered and std scaled.

- **img metas** (*list[dict]*) –list of image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys see `mmdet.datasets.pipelines.Collect`.
- **proposals** (*list[Tensor] | None*) –override rpn proposals with custom proposals. Use when *with_rpn* is `False`. Default: `None`.
- **rescale** (*bool*) –If `True`, return boxes in original image space.

返回

BBox results of each image and classes. The outer list corresponds to each image. The inner list corresponds to each class.

返回类型 `list[list[np.ndarray]]`

```
class mmfewshot.detection.models.detectors.QuerySupportDetector (backbone:
    mmcv.utils.config.ConfigDict,
    neck: Op-
    tional[mmcv.utils.config.ConfigDict]
    = None,
    support_backbone:
    Op-
    tional[mmcv.utils.config.ConfigDict]
    = None,
    support_neck: Op-
    tional[mmcv.utils.config.ConfigDict]
    = None, roi_head:
    Op-
    tional[mmcv.utils.config.ConfigDict]
    = None, roi_head:

    tional[mmcv.utils.config.ConfigDict]
    = None, init_cfg: Op-
    tional[mmcv.utils.config.ConfigDict]
    = None)
```

Base class for two-stage detectors in query-support fashion.

Query-support detectors typically consisting of a region proposal network and a task-specific regression head. There are two pipelines for query and support data respectively.

参数

- **backbone** (*dict*) –Config of the backbone for query data.
- **neck** (*dict* | *None*) –Config of the neck for query data and probably for support data. Default: *None*.
- **support_backbone** (*dict* | *None*) –Config of the backbone for support data only. If *None*, support and query data will share same backbone. Default: *None*.
- **support_neck** (*dict* | *None*) –Config of the neck for support data only. Default: *None*.
- **rpn_head** (*dict* | *None*) –Config of rpn_head. Default: *None*.
- **roi_head** (*dict* | *None*) –Config of roi_head. Default: *None*.
- **train_cfg** (*dict* | *None*) –Training config. Useless in CenterNet, but we keep this variable for SingleStageDetector. Default: *None*.
- **test_cfg** (*dict* | *None*) –Testing config of CenterNet. Default: *None*.
- **pretrained** (*str* | *None*) –model pretrained path. Default: *None*.
- **init_cfg** (*dict* | *list[dict]* | *None*) –Initialization config dict. Default: *None*

aug_test (***kwargs*)

Test with augmentation.

extract_feat (*img: torch.Tensor*) → *List[torch.Tensor]*

Extract features of query data.

参数 **img** (*Tensor*) –Input images of shape (N, C, H, W). Typically these should be mean centered and std scaled.

返回 Features of query images.

返回类型 *list[Tensor]*

extract_query_feat (*img: torch.Tensor*) → *List[torch.Tensor]*

Extract features of query data.

参数 **img** (*Tensor*) –Input images of shape (N, C, H, W). Typically these should be mean centered and std scaled.

返回

Features of support images, each item with shape (N, C, H, W).

返回类型 *list[Tensor]*

abstract extract_support_feat (*img: torch.Tensor*)

Extract features of support data.

forward (*query_data: Optional[Dict] = None, support_data: Optional[Dict] = None, img: Optional[List[torch.Tensor]] = None, img metas: Optional[List[Dict]] = None, mode: typing_extensions.Literal[train, model_init, test] = 'train', **kwargs*) → Dict

Calls one of (*forward_train()*, *forward_test()* and *forward_model_init()*) according to the *mode*. The inputs of forward function would change with the *mode*.

- When *mode* is 'train', the input will be query and support data for training.

- When *mode* is 'model_init', the input will be support template data at least including (*img*, *img_metas*).

- When *mode* is 'test', the input will be test data at least including (*img*, *img_metas*).

参数

- **query_data** (*dict*) –Used for *forward_train()*. Dict of query data and data info where each dict has: *img*, *img_metas*, *gt_bboxes*, *gt_labels*, *gt_bboxes_ignore*. Default: None.
- **support_data** (*dict*) –Used for *forward_train()*. Dict of support data and data info dict where each dict has: *img*, *img_metas*, *gt_bboxes*, *gt_labels*, *gt_bboxes_ignore*. Default: None.
- **img** (*list[Tensor]*) –Used for func:*forward_test* or *forward_model_init()*. List of tensors of shape (1, C, H, W). Typically these should be mean centered and std scaled. Default: None.
- **img_metas** (*list[dict]*) –Used for func:*forward_test* or *forward_model_init()*. List of image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys, see `mmdet.datasets.pipelines.Collect`. Default: None.
- **mode** (*str*) –Indicate which function to call. Options are 'train', 'model_init' and 'test'. Default: 'train'.

abstract forward_model_init (*img: torch.Tensor, img_metas: List[Dict], gt_bboxes:*

Optional[List[torch.Tensor]] = None, gt_labels:

*Optional[List[torch.Tensor]] = None, **kwargs*)

extract and save support features for model initialization.

forward_train (*query_data: Dict, support_data: Dict, proposals: Optional[List] = None, **kwargs*) → Dict

Forward function for training.

参数

- **query_data** (*dict*) –In most cases, dict of query data contains: *img*, *img metas*, *gt_bboxes*, *gt_labels*, *gt_bboxes_ignore*.
- **support_data** (*dict*) –In most cases, dict of support data contains: *img*, *img metas*, *gt_bboxes*, *gt_labels*, *gt_bboxes_ignore*.
- **proposals** (*list*) –Override rpn proposals with custom proposals. Use when *with_rpn* is False. Default: None.

返回 a dictionary of loss components

返回类型 dict[str, Tensor]

abstract_model_init (**kwargs)

process the saved support features for model initialization.

simple_test (*img: torch.Tensor*, *img_metas: List[Dict]*, *proposals: Optional[List[torch.Tensor]] = None*, *rescale: bool = False*)

Test without augmentation.

train_step (*data: Dict*, *optimizer: Union[object, Dict]*) → Dict

The iteration step during training.

This method defines an iteration step during training, except for the back propagation and optimizer updating, which are done in an optimizer hook. Note that in some complicated cases or models, the whole process including back propagation and optimizer updating is also defined in this method, such as GAN. For most of query-support detectors, the batch size denote the batch size of query data.

参数

- **data** (*dict*) –The output of dataloader.
- **optimizer** (*torch.optim.Optimizer | dict*) –The optimizer of runner is passed to `train_step()`. This argument is unused and reserved.

返回

It should contain at least 3 keys: loss, log_vars, num_samples.

- `loss` is a tensor for back propagation, which can be a weighted sum of multiple losses. - `log_vars` contains all the variables to be sent to the logger. - `num_samples` indicates the batch size (when the model is DDP, it means the batch size on each GPU), which is used for averaging the logs.

返回类型 dict

val_step (*data: Dict*, *optimizer: Optional[Union[object, Dict]] = None*) → Dict

The iteration step during validation.

This method shares the same signature as `train_step()`, but used during val epochs. Note that the evaluation after training epochs is not implemented with this method, but an evaluation hook.

```
class mmfewshot.detection.models.detectors.TFA (backbone, neck=None, rpn_head=None,
                                             roi_head=None, train_cfg=None,
                                             test_cfg=None, pretrained=None,
                                             init_cfg=None)
```

Implementation of TFA

23.4.4 losses

```
class mmfewshot.detection.models.losses.SupervisedContrastiveLoss (temperature: float
                                                                    = 0.2,
                                                                    iou_threshold:

                                                                    reweight_type: typ-
                                                                    ing_extensions.Literal[none,
                                                                    exp, linear] =
                                                                    'none', reduction:
                                                                    typ-
                                                                    ing_extensions.Literal[none,
                                                                    mean, sum] =
                                                                    'mean',
                                                                    loss_weight: float
                                                                    = 1.0)
```

Supervised Contrastive LOSS.

This part of code is modified from <https://github.com/MegviiDetection/FSCE>.

参数

- **temperature** (*float*) – A constant to be divided by cosine similarity to enlarge the magnitude. Default: 0.2.
- **iou_threshold** (*float*) – Consider proposals with higher credibility to increase consistency. Default: 0.5.
- **reweight_type** (*str*) – Reweight function for contrastive loss. Options are (‘none’ , ‘exp’ , ‘linear’). Default: ‘none’ .
- **reduction** (*str*) – The method used to reduce the loss into a scalar. Default: ‘mean’ . Options are “none” , “mean” and “sum” .
- **loss_weight** (*float*) – Weight of loss. Default: 1.0.

forward (*features: torch.Tensor, labels: torch.Tensor, ious: torch.Tensor, decay_rate: Optional[float] = None, weight: Optional[torch.Tensor] = None, avg_factor: Optional[int] = None, reduction_override: Optional[str] = None*) → torch.Tensor

Forward function.

参数

- **features** (*tensor*) –Shape of (N, K) where N is the number of features to be compared and K is the channels.
- **labels** (*tensor*) –Shape of (N).
- **ious** (*tensor*) –Shape of (N).
- **decay_rate** (*float | None*) –The decay rate for total loss. Default: None.
- **weight** (*Tensor | None*) –The weight of loss for each prediction with shape of (N). Default: None.
- **avg_factor** (*int | None*) –Average factor that is used to average the loss. Default: None.
- **reduction_override** (*str | None*) –The reduction method used to override the original reduction method of the loss. Options are “none”, “mean” and “sum”. Default: None.

返回 The calculated loss.

返回类型 Tensor

23.4.5 roi_heads

```
class mmfewshot.detection.models.roi_heads.ContrastiveBBoxHead (mlp_head_channels:

                                                                    bool = False, eps: float
                                                                    = 1e-05, *args,
                                                                    **kwargs)
```

BBoxHead for FSCE.

参数

- **mlp_head_channels** (*int*) –Output channels of contrast branch mlp. Default: 128.
- **with_weight_decay** (*bool*) –Whether to decay loss weight. Default: False.
- **loss_contrast** (*dict*) –Config of contrast loss.
- **scale** (*int*) –Scaling factor of *cls_score*. Default: 20.
- **learnable_scale** (*bool*) –Learnable global scaling factor. Default: False.
- **eps** (*float*) –Constant variable to avoid division by zero.

forward (*x: torch.Tensor*) → Tuple[torch.Tensor, torch.Tensor, torch.Tensor]

Forward function.

参数 **x** (*Tensor*) –Shape of (num_proposals, C, H, W).

返回

cls_score (*Tensor*): Cls scores, has shape (num_proposals, num_classes).

bbox_pred (*Tensor*): Box energies / deltas, has shape (num_proposals, 4).

contrast_feat (*Tensor*): Box features for contrast loss, has shape (num_proposals, C).

返回类型 tuple

loss_contrast (*contrast_feat: torch.Tensor, proposal_iou: torch.Tensor, labels: torch.Tensor,*
reduction_override: Optional[str] = None) → Dict

Loss for contract.

参数

- **contrast_feat** (*tensor*) –BBox features with shape (N, C) used for contrast loss.
- **proposal_iious** (*tensor*) –IoU between proposal and ground truth corresponding to each BBox features with shape (N).
- **labels** (*tensor*) –Labels for each BBox features with shape (N).
- **reduction_override** (*str* | *None*) –The reduction method used to override the original reduction method of the loss. Options are “none”, “mean” and “sum”. Default: None.

返回 The calculated loss.

返回类型 Dict

set_decay_rate (*decay_rate: float*) → None

Contrast loss weight decay hook will set the *decay_rate* according to iterations.

参数 **decay_rate** (*float*) –Decay rate for weight decay.

```
class mmfewshot.detection.models.roi_heads.ContrastiveRoIHead (bbox_roi_extractor=None,

```

RoI head for FSCE.

```
class mmfewshot.detection.models.roi_heads.CosineSimBBoxHead (scale: int = 20,
                                                         learnable_scale: bool =
                                                         False, eps: float = 1e-05,
                                                         *args, **kwargs)
```

BBoxHead for TFA.

The code is modified from the official implementation <https://github.com/ucbdrive/few-shot-object-detection/>

参数

- **scale** (*int*) –Scaling factor of *cls_score*. Default: 20.
- **learnable_scale** (*bool*) –Learnable global scaling factor. Default: False.
- **eps** (*float*) –Constant variable to avoid division by zero.

forward (*x: torch.Tensor*) → Tuple[torch.Tensor, torch.Tensor]

Forward function.

参数 \mathbf{x} (*Tensor*) –Shape of (num_proposals, C, H, W).

返回

cls_score (*Tensor*): Cls scores, has shape (num_proposals, num_classes).

bbox_pred (*Tensor*): Box energies / deltas, has shape (num_proposals, 4).

返回类型 `tuple`

```
class mmfewshot.detection.models.roi_heads.FSDetViewRoIHead (aggregation_layer:
                                                                Optional[Dict] = None,
                                                                **kwargs)
```

Roi head for `FSDetView`.

参数 **aggregation_layer** (*dict*) –Config of *aggregation_layer*. Default: None.

```
class mmfewshot.detection.models.roi_heads.MetaRCNNResLayer (*args, **kwargs)
```

Shared resLayer for metarcnn and fsdetview.

It provides different forward logics for query and support images.

forward (*x: torch.Tensor*) → *torch.Tensor*

Forward function for query images.

参数 \mathbf{x} (*Tensor*) –Features from backbone with shape (N, C, H, W).

返回 Shape of (N, C).

返回类型 `Tensor`

forward_support (*x: torch.Tensor*) → *torch.Tensor*

Forward function for support images.

参数 \mathbf{x} (*Tensor*) –Features from backbone with shape (N, C, H, W).

返回 Shape of (N, C).

返回类型 `Tensor`

```
class mmfewshot.detection.models.roi_heads.MetaRCNNRoIHead (aggregation_layer: Op-
                                                                tional[mmcv.utils.config.ConfigDict]
                                                                = None, **kwargs)
```

Roi head for `MetaRCNN`.

参数 **aggregation_layer** (*ConfigDict*) –Config of *aggregation_layer*. Default: None.

extract_query_roi_feat (*feats: List[torch.Tensor], rois: torch.Tensor*) → *torch.Tensor*

Extracting query BBOX features, which is used in both training and testing.

参数

- **feats** (*list[Tensor]*) –List of query features, each item with shape (N, C, H, W).

- **rois** (*Tensor*) –shape with (m, 5).

返回 RoI features with shape (N, C).

返回类型 Tensor

extract_support_feats (*feats: List[torch.Tensor]*) → List[torch.Tensor]

Forward support features through shared layers.

参数 **feats** (*list [Tensor]*) –List of support features, each item with shape (N, C, H, W).

返回

List of support features, each item with shape (N, C).

返回类型 list[Tensor]

forward_train (*query_feats: List[torch.Tensor], support_feats: List[torch.Tensor], proposals: List[torch.Tensor], query_img metas: List[Dict], query_gt_bboxes: List[torch.Tensor], query_gt_labels: List[torch.Tensor], support_gt_labels: List[torch.Tensor], query_gt_bboxes_ignore: Optional[List[torch.Tensor]] = None, **kwargs*) → Dict

Forward function for training.

参数

- **query_feats** (*list [Tensor]*) –List of query features, each item with shape (N, C, H, W).
- **support_feats** (*list [Tensor]*) –List of support features, each item with shape (N, C, H, W).
- **proposals** (*list [Tensor]*) –List of region proposals with positive and negative pairs.
- **query_img metas** (*list [dict]*) –List of query image info dict where each dict has: ‘img_shape’, ‘scale_factor’, ‘flip’, and may also contain ‘filename’, ‘ori_shape’, ‘pad_shape’, and ‘img_norm_cfg’. For details on the values of these keys see *mmdet/datasets/pipelines/formatting.py:Collect*.
- **query_gt_bboxes** (*list [Tensor]*) –Ground truth bboxes for each query image, each item with shape (num_gts, 4) in [tl_x, tl_y, br_x, br_y] format.
- **query_gt_labels** (*list [Tensor]*) –Class indices corresponding to each box of query images, each item with shape (num_gts).
- **support_gt_labels** (*list [Tensor]*) –Class indices corresponding to each box of support images, each item with shape (1).
- **query_gt_bboxes_ignore** (*list [Tensor] | None*) –Specify which bounding boxes can be ignored when computing the loss. Default: None.

返回 A dictionary of loss components

返回类型 dict[str, Tensor]

simple_test (*query_feats: List[torch.Tensor], support_feats_dict: Dict, proposal_list: List[torch.Tensor], query_img metas: List[Dict], rescale: bool = False*) → List[List[numpy.ndarray]]

Test without augmentation.

参数

- **query_feats** (*list [Tensor]*) –Features of query image, each item with shape (N, C, H, W).
- **support_feats_dict** (*dict [int, Tensor]*) –used for inference only, each key is the class id and value is the support template features with shape (1, C).
- **proposal_list** (*list [Tensors]*) –list of region proposals.
- **query_img metas** (*list [dict]*) –list of image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys see `mmdet.datasets.pipelines.Collect`.
- **rescale** (*bool*) –Whether to rescale the results. Default: False.

返回

BBox results of each image and classes. The outer list corresponds to each image. The inner list corresponds to each class.

返回类型 list[list[np.ndarray]]

simple_test_bboxes (*query_feats: List[torch.Tensor], support_feats_dict: Dict, query_img metas: List[Dict], proposals: List[torch.Tensor], rcnn_test_cfg: mmdcv.utils.config.ConfigDict, rescale: bool = False*) → Tuple[List[torch.Tensor], List[torch.Tensor]]

Test only det bboxes without augmentation.

参数

- **query_feats** (*list [Tensor]*) –Features of query image, each item with shape (N, C, H, W).
- **support_feats_dict** (*dict [int, Tensor]*) –used for inference only, each key is the class id and value is the support template features with shape (1, C).
- **query_img metas** (*list [dict]*) –list of image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys see `mmdet.datasets.pipelines.Collect`.
- **proposals** (*list [Tensor]*) –Region proposals.
- **(obj (rcnn_test_cfg) –ConfigDict): test_cfg** of R-CNN.
- **rescale** (*bool*) –If True, return boxes in original image space. Default: False.

返回

Each tensor in first list with shape (num_boxes, 4) and with shape (num_boxes,) in second list. The length of both lists should be equal to batch_size.

返回类型 tuple[list[Tensor], list[Tensor]]

```
class mmfewshot.detection.models.roi_heads.MultiRelationBBoxHead(patch_relation: bool
                                                                    = True,
                                                                    local_correlation:
                                                                    bool = True,
                                                                    global_relation:
                                                                    bool = True, *args,
                                                                    **kwargs)
```

BBox head for [Attention RPN](#).

参数

- **patch_relation** (*bool*) – Whether use patch_relation head for classification. Following the official implementation, *patch_relation* always be True, because only patch relation head contain regression head. Default: True.
- **local_correlation** (*bool*) – Whether use local_correlation head for classification. Default: True.
- **global_relation** (*bool*) – Whether use global_relation head for classification. Default: True.

forward (*query_feat: torch.Tensor, support_feat: torch.Tensor*) → Tuple[torch.Tensor, torch.Tensor]

Forward function.

参数

- **query_feat** (*Tensor*) – Shape of (num_proposals, C, H, W).
- **support_feat** (*Tensor*) – Shape of (1, C, H, W).

返回

cls_score (*Tensor*): Cls scores, has shape (num_proposals, num_classes).

bbox_pred (*Tensor*): Box energies / deltas, has shape (num_proposals, 4).

返回类型 tuple

loss (*cls_scores: torch.Tensor, bbox_preds: torch.Tensor, rois: torch.Tensor, labels: torch.Tensor, label_weights: torch.Tensor, bbox_targets: torch.Tensor, bbox_weights: torch.Tensor, num_pos_pair_samples: int, reduction_override: Optional[str] = None, sample_fractions: Sequence[Union[int, float]] = (1, 2, 1)*) → Dict

Compute losses of the head.

参数

- **cls_scores** (*Tensor*) – Box scores with shape of (num_proposals, num_classes)

- **bbbox_preds** (*Tensor*) –Box energies / deltas with shape of (num_proposals, num_classes * 4)
- **rois** (*Tensor*) –shape (N, 4) or (N, 5)
- **labels** (*Tensor*) –Labels of proposals with shape (num_proposals).
- **label_weights** (*Tensor*) –Label weights of proposals with shape (num_proposals).
- **bbbox_targets** (*Tensor*) –BBox regression targets of each proposal weight with shape (num_proposals, num_classes * 4).
- **bbbox_weights** (*Tensor*) –BBox regression loss weights of each proposal with shape (num_proposals, num_classes * 4).
- **num_pos_pair_samples** (*int*) –Number of samples from positive pairs.
- **reduction_override** (*str* | *None*) –The reduction method used to override the original reduction method of the loss. Options are “none”, “mean” and “sum”. Default: None.
- **sample_fractions** (*Sequence[int | float]*) –Fractions of positive samples, negative samples from positive pair, negative samples from negative pair. Default: (1, 2, 1).

返回 A dictionary of loss components.

返回类型 dict[str, Tensor]

```
class mmfewshot.detection.models.roi_heads.MultiRelationRoIHead(num_support_ways:
                                                                int = 2,
                                                                num_support_shots:
                                                                int = 5,
                                                                sample_fractions:
                                                                Sequence[Union[int,
                                                                float]] = (1, 2, 1),
                                                                **kwargs)
```

Roi head for [AttentionRPN](#).

参数

- **num_support_ways** (*int*) –Number of sampled classes (pos + neg).
- **num_support_shots** (*int*) –Number of shot for each classes.
- **sample_fractions** (*Sequence[int | float]*) –Fractions of positive samples, negative samples from positive pair, negative samples from negative pair. Default: (1, 2, 1).

extract_roi_feat (*feats: List[torch.Tensor], rois: torch.Tensor*) → torch.Tensor

Extract BBOX feature function used in both training and testing.

参数

- **feats** (*list[Tensor]*) –Features from backbone, each item with shape (N, C, W, H).

- **rois** (*Tensor*) –shape (num_proposals, 5).

返回 Roi features with shape (num_proposals, C).

返回类型 *Tensor*

forward_train (*query_feats: List[torch.Tensor], support_feats: List[torch.Tensor], proposals: List[torch.Tensor], query_img metas: List[Dict], query_gt_bboxes: List[torch.Tensor], query_gt_labels: List[torch.Tensor], support_gt_bboxes: List[torch.Tensor], query_gt_bboxes_ignore: Optional[List[torch.Tensor]] = None, **kwargs*) → *Dict*

All arguments excepted proposals are passed in tuple of (query, support).

参数

- **query_feats** (*list [Tensor]*) –List of query features, each item with shape (N, C, H, W).
- **support_feats** (*list [Tensor]*) –List of support features, each item with shape (N, C, H, W).
- **proposals** (*list [Tensor]*) –List of region proposals with positive and negative query-support pairs.
- **query_img metas** (*list [dict]*) –List of query image info dict where each dict has: ‘img_shape’, ‘scale_factor’, ‘flip’, and may also contain ‘filename’, ‘ori_shape’, ‘pad_shape’, and ‘img_norm_cfg’. For details on the values of these keys see *mmdet/datasets/pipelines/formatting.py:Collect*.
- **query_gt_bboxes** (*list [Tensor]*) –Ground truth bboxes for each query image with shape (num_gts, 4) in [tl_x, tl_y, br_x, br_y] format.
- **query_gt_labels** (*list [Tensor]*) –Class indices corresponding to each bbox from query image.
- **support_gt_bboxes** (*list [Tensor]*) –Ground truth bboxes for each support image with shape (num_gts, 4) in [tl_x, tl_y, br_x, br_y] format.
- **query_gt_bboxes_ignore** (*None | list [Tensor]*) –Specify which bounding boxes from query image can be ignored when computing the loss. Default: None.

返回 A dictionary of loss components.

返回类型 *dict[str, Tensor]*

simple_test (*query_feats: List[torch.Tensor], support_feat: torch.Tensor, proposals: List[torch.Tensor], query_img metas: List[Dict], rescale: bool = False*) → *List[List[numpy.ndarray]]*

Test without augmentation.

参数

- **query_feats** (*list [Tensor]*) –List of query features, each item with shape (N, C, H, W).

- **support_feat** (*Tensor*) –Support features with shape (N, C, H, W).
- **proposals** (*Tensor or list[Tensor]*) –list of region proposals.
- **query_img metas** (*list[dict]*) –list of query image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys see `mmdet.datasets.pipelines.Collect`.
- **proposals** –Region proposals. Default: None.
- **rescale** (*bool*) –Whether to rescale the results. Default: False.

返回

BBox results of each image and classes. The outer list corresponds to each image. The inner list corresponds to each class.

返回类型 `list[list[np.ndarray]]`

simple_test_bboxes (*query_feats: List[torch.Tensor]*, *support_feat: torch.Tensor*, *query_img metas: List[Dict]*, *proposals: List[torch.Tensor]*, *rcnn_test_cfg: mmcv.utils.config.ConfigDict*, *rescale: bool = False*) → `Tuple[List[torch.Tensor], List[torch.Tensor]]`

Test only det bboxes without augmentation.

参数

- **query_feats** (*list[Tensor]*) –List of query features, each item with shape (N, C, H, W).
- **support_feat** (*Tensor*) –Support feature with shape (N, C, H, W).
- **query_img metas** (*list[dict]*) –list of image info dict where each dict has: *img_shape*, *scale_factor*, *flip*, and may also contain *filename*, *ori_shape*, *pad_shape*, and *img_norm_cfg*. For details on the values of these keys see `mmdet.datasets.pipelines.Collect`.
- **proposals** (*list[Tensor]*) –Region proposals.
- (**obj** (*rcnn_test_cfg*) –*ConfigDict*): *test_cfg* of R-CNN.
- **rescale** (*bool*) –If True, return boxes in original image space. Default: False.

返回

BBox of shape [N, num_bboxes, 5] and class labels of shape [N, num_bboxes].

返回类型 `tuple[Tensor, Tensor]`

```
class mmfewshot.detection.models.roi_heads.TwoBranchRoIHead (bbox_roi_extractor=None,
                                                            bbox_head=None,
                                                            mask_roi_extractor=None,
                                                            mask_head=None,
                                                            shared_head=None,
                                                            train_cfg=None,
                                                            test_cfg=None,
                                                            pretrained=None,
                                                            init_cfg=None)
```

RoI head for MPSR.

forward_auxiliary_train (*feats*: Tuple[torch.Tensor], *gt_labels*: List[torch.Tensor]) → Dict

Forward function and calculate loss for auxiliary data in training.

参数

- **feats** (*tuple*[Tensor]) –List of features at multiple scales, each is a 4D-tensor.
- **gt_labels** (*list*[Tensor]) –List of class indices corresponding to each features, each is a 4D-tensor.

返回 a dictionary of loss components

返回类型 dict[str, Tensor]

23.4.6 utils

23.5 detection.utils

```
class mmfewshot.detection.utils.ContrastiveLossDecayHook (decay_steps: Sequence[int],
                                                          decay_rate: float = 0.5)
```

Hook for contrast loss weight decay used in FSCE.

参数

- **decay_steps** (*list*[int] | *tuple*[int]) –Each item in the list is the step to decay the loss weight.
- **decay_rate** (*float*) –Decay rate. Default: 0.5.

```
class mmfewshot.utils.DistributedInfiniteGroupSampler (dataset: Iterable, samples_per_gpu:  
int = 1, num_replicas: Optional[int]  
= None, rank: Optional[int] = None,  
seed: int = 0, shuffle: bool = True)
```

Similar to *InfiniteGroupSampler* but in distributed version.

The length of sampler is set to the actual length of dataset, thus the length of dataloader is still determined by the dataset. The implementation logic is referred to https://github.com/facebookresearch/detectron2/blob/main/detectron2/data/samplers/grouped_batch_sampler.py

参数

- **dataset** (*Iterable*) –The dataset.
- **samples_per_gpu** (*int*) –Number of training samples on each GPU, i.e., batch size of each GPU. Default: 1.
- **num_replicas** (*int | None*) –Number of processes participating in distributed training. Default: None.
- **rank** (*int | None*) –Rank of current process. Default: None.
- **seed** (*int*) –Random seed. Default: 0.
- **shuffle** (*bool*) –Whether shuffle the indices of a dummy *epoch*, it should be noted that *shuffle* can not guarantee that you can generate sequential indices because it need to ensure that all indices in a batch is in a group. Default: True.

```
class mmfewshot.utils.DistributedInfiniteSampler (dataset: Iterable, num_replicas: Optional[int]
= None, rank: Optional[int] = None, seed:
int = 0, shuffle: bool = True)
```

Similar to *InfiniteSampler* but in distributed version.

The length of sampler is set to the actual length of dataset, thus the length of dataloader is still determined by the dataset. The implementation logic is referred to https://github.com/facebookresearch/detectron2/blob/main/detectron2/data/samplers/grouped_batch_sampler.py

参数

- **dataset** (*Iterable*) –The dataset.
- **num_replicas** (*int* | *None*) –Number of processes participating in distributed training. Default: None.
- **rank** (*int* | *None*) –Rank of current process. Default: None.
- **seed** (*int*) –Random seed. Default: 0.
- **shuffle** (*bool*) –Whether shuffle the dataset or not. Default: True.

```
class mmfewshot.utils.InfiniteEpochBasedRunner (model, batch_processor=None, optimizer=None,
work_dir=None, logger=None, meta=None,
max_iters=None, max_epochs=None)
```

Epoch-based Runner supports dataloader with *InfiniteSampler*.

The workers of dataloader will re-initialize, when the iterator of dataloader is created. *InfiniteSampler* is designed to avoid these time consuming operations, since the iterator with *InfiniteSampler* will never reach the end.

```
class mmfewshot.utils.InfiniteGroupSampler (dataset: Iterable, samples_per_gpu: int = 1, seed: int
= 0, shuffle: bool = True)
```

Similar to *InfiniteSampler*, but all indices in a batch should be in the same group of flag.

The length of sampler is set to the actual length of dataset, thus the length of dataloader is still determined by the dataset. The implementation logic is referred to https://github.com/facebookresearch/detectron2/blob/main/detectron2/data/samplers/grouped_batch_sampler.py

参数

- **dataset** (*Iterable*) –The dataset.
- **samples_per_gpu** (*int*) –Number of training samples on each GPU, i.e., batch size of each GPU. Default: 1.
- **seed** (*int*) –Random seed. Default: 0.
- **shuffle** (*bool*) –Whether shuffle the indices of a dummy *epoch*, it should be noted that *shuffle* can not guarantee that you can generate sequential indices because it need to ensure that all indices in a batch is in a group. Default: True.

class mmfewshot.utils.InfiniteSampler (dataset: Iterable, seed: int = 0, shuffle: bool = True)

Return a infinite stream of index.

The length of sampler is set to the actual length of dataset, thus the length of dataloader is still determined by the dataset. The implementation logic is referred to https://github.com/facebookresearch/detectron2/blob/main/detectron2/data/samplers/grouped_batch_sampler.py

参数

- **dataset** (*Iterable*) –The dataset.
- **seed** (*int*) –Random seed. Default: 0.
- **shuffle** (*bool*) –Whether shuffle the dataset or not. Default: True.

mmfewshot.utils.compat_cfg (cfg)

This function would modify some filed to keep the compatibility of config.

For example, it will move some args which will be deprecated to the correct fields.

mmfewshot.utils.local_numpy_seed (seed: Optional[int] = None) → None

Run numpy codes with a local random seed.

If seed is None, the default random state will be used.

mmfewshot.utils.multi_pipeline_collate_fn (batch, samples_per_gpu: int = 1)

Puts each data field into a tensor/DataContainer with outer dimension batch size. This is designed to support the case that the `__getitem__()` of dataset return more than one images, such as query_support dataloader. The main difference with the `collate_fn()` in mmcv is it can process `list[list[DataContainer]]`.

Extend default_collate to add support for **:type:'~mmcv.parallel.DataContainer'**. There are 3 cases:

1. `cpu_only = True`, e.g., meta data.
2. `cpu_only = False, stack = True`, e.g., images tensors.
3. `cpu_only = False, stack = False`, e.g., gt bboxes.

:param batch (list[list[mmcv.parallel.DataContainer]] | list[mmcv.parallel.DataContainer]): Data of single batch.

参数 samples_per_gpu (*int*) –The number of samples of single GPU.

mmfewshot.utils.sync_random_seed (seed=None, device='cuda')

Propagating the seed of rank 0 to all other ranks.

Make sure different ranks share the same seed. All workers must call this function, otherwise it will deadlock. This method is generally used in *DistributedSampler*, because the seed should be identical across all processes in the distributed group. In distributed sampling, different ranks should sample non-overlapped data in the dataset. Therefore, this function is used to make sure that each rank shuffles the data indices in the same order based on the same seed. Then different ranks could use different indices to select non-overlapped data from the same data list.

:param seed: The seed. Default to None. :type seed: int, Optional :param device: The device where the seed will be put on.

Default to 'cuda' .

返回 Seed to be used.

返回类型 int
